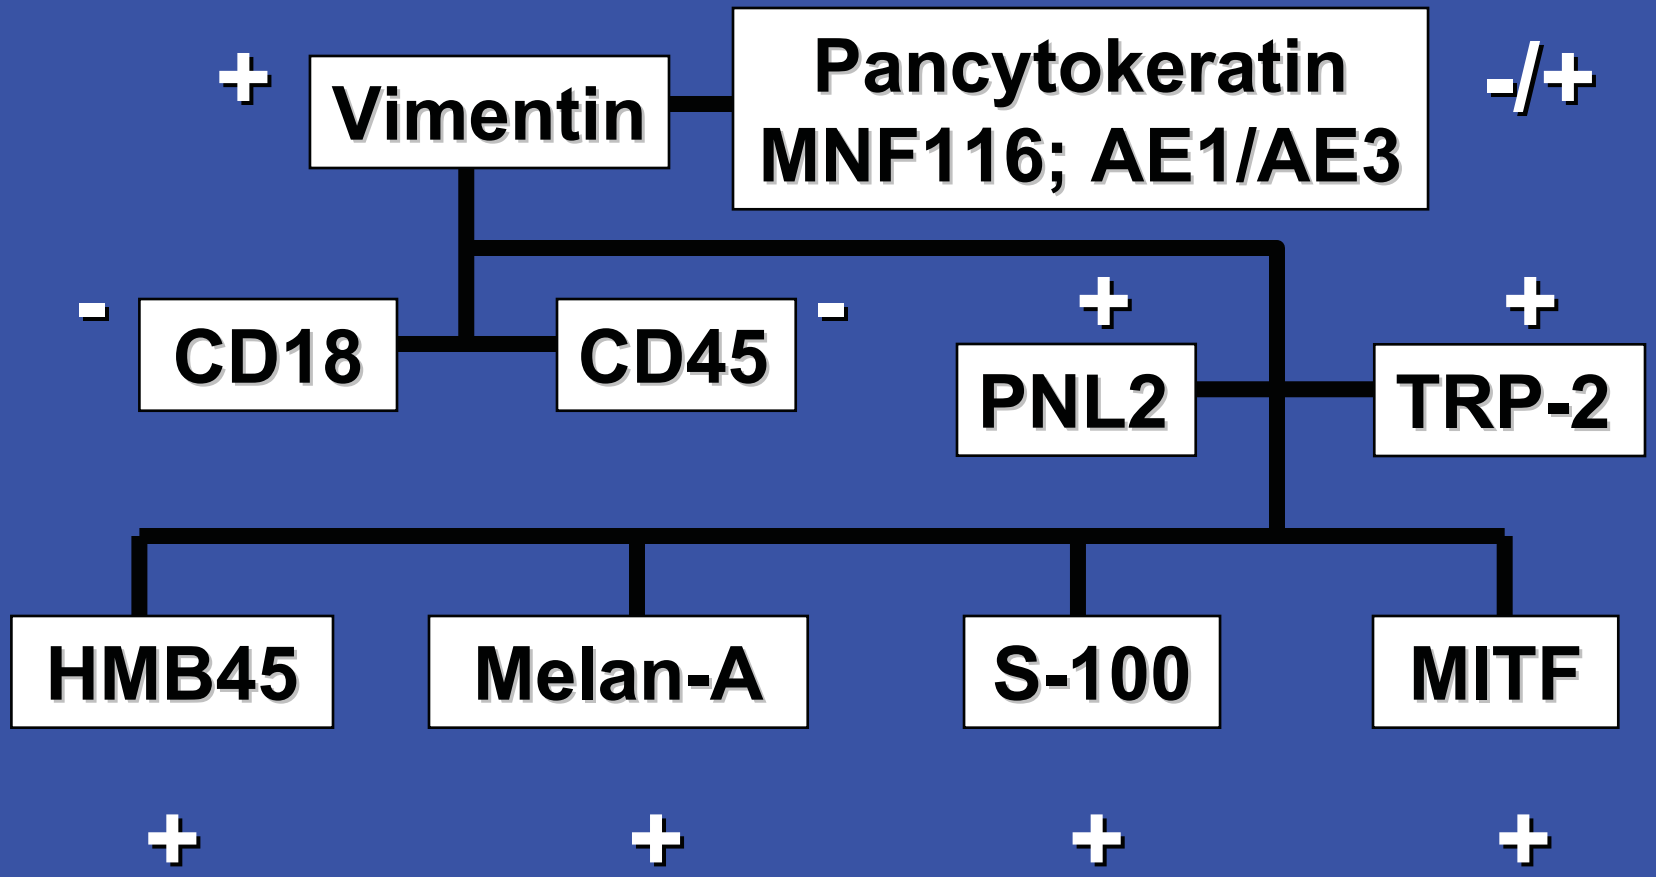
What's your
Diagnosis

Cutaneous and Oral Melanomas

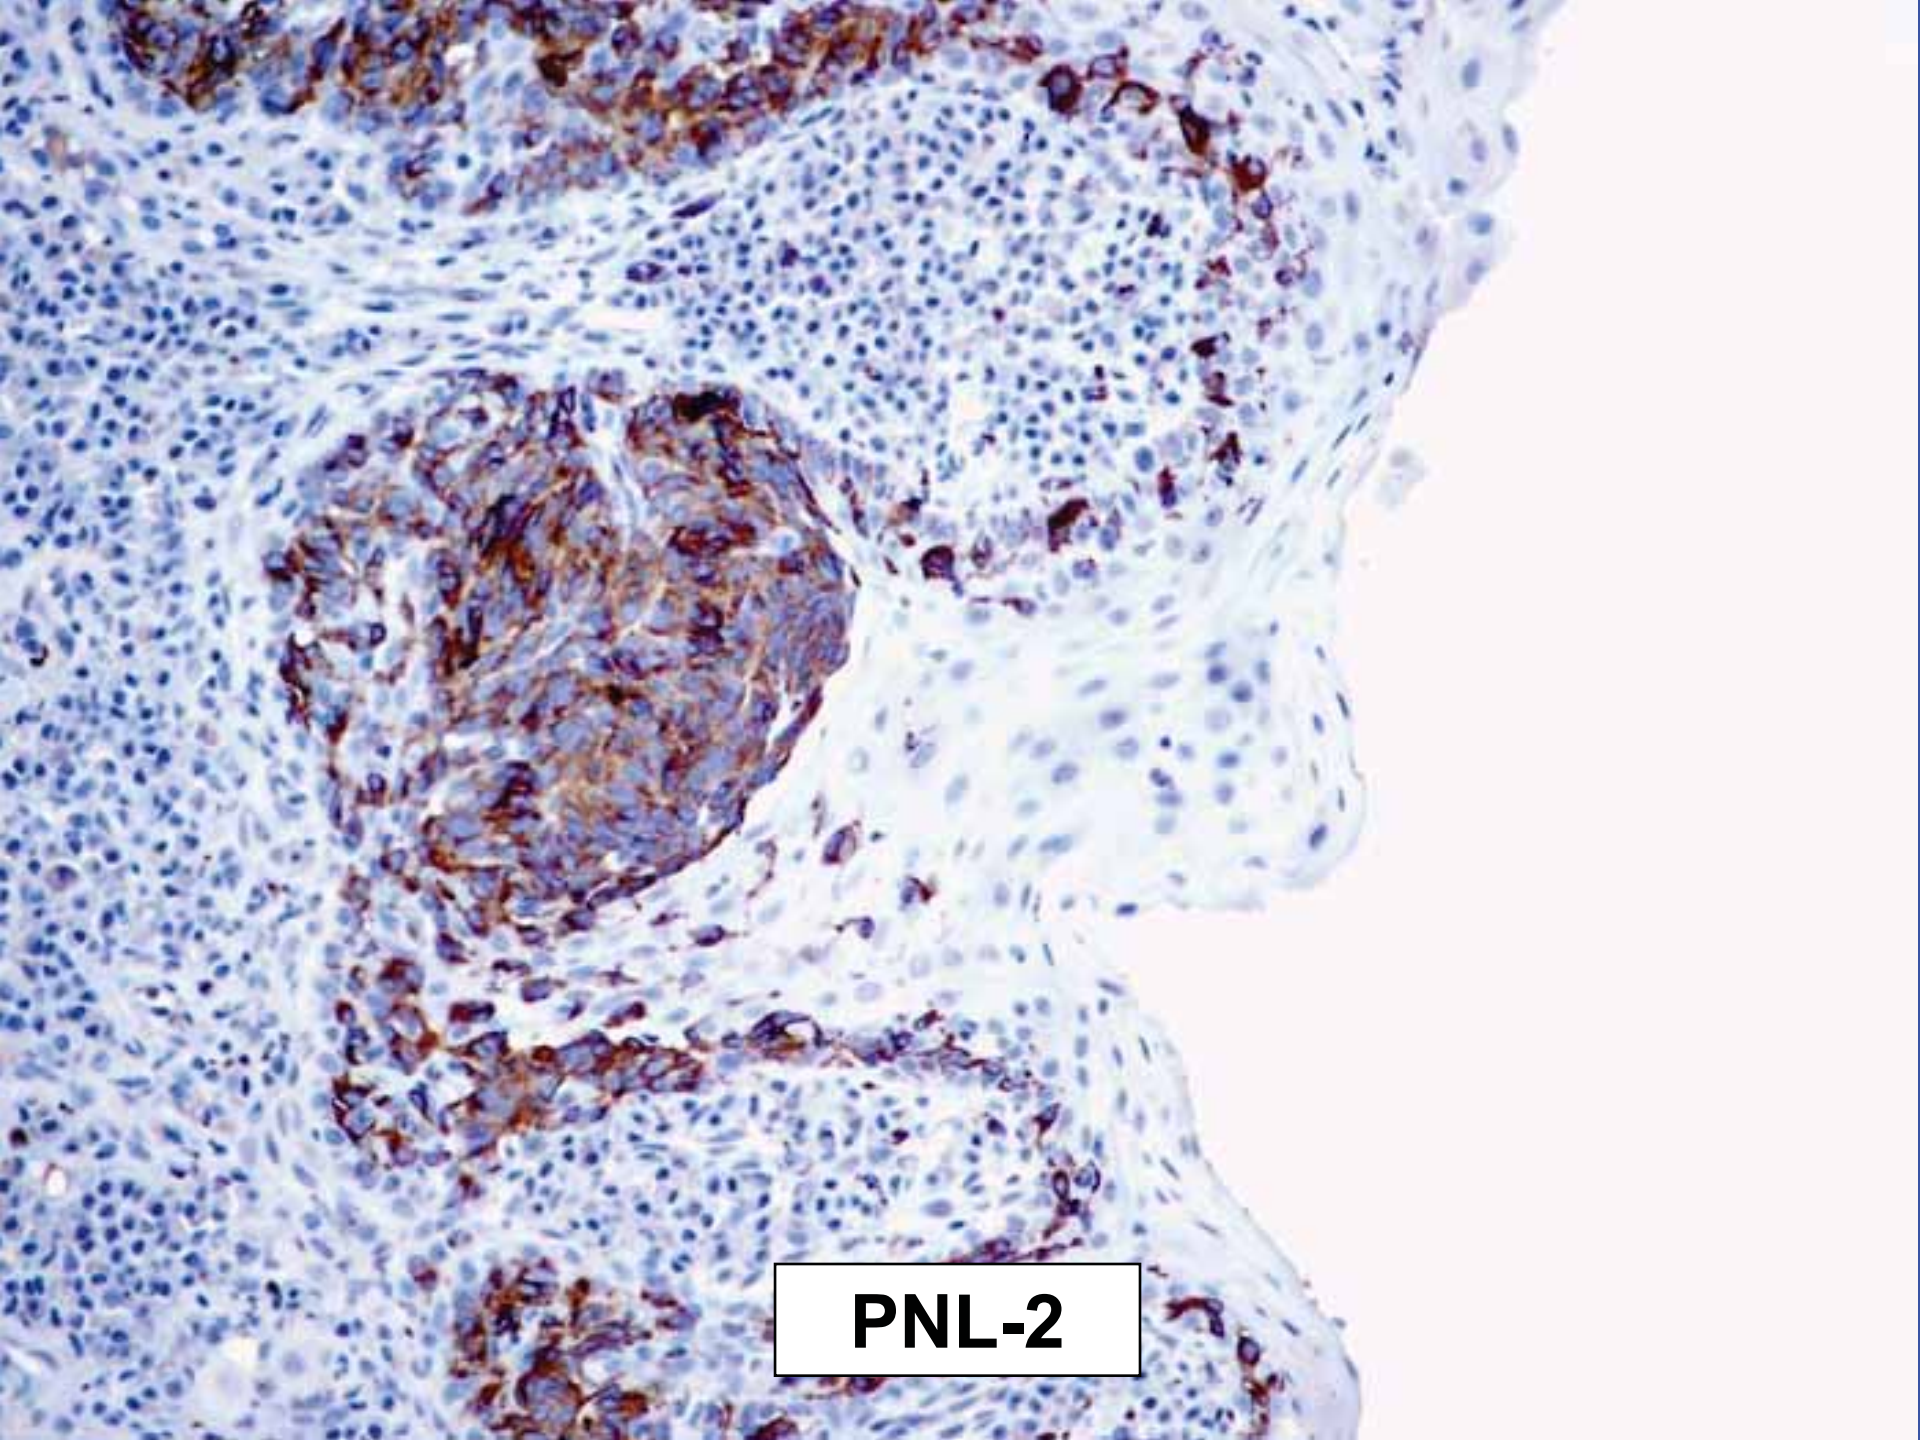


Cutaneous and Oral Melanomas

- Melan A - product of the MART-1 gene (Melanoma antigen recognized by autologous cytotoxic T-lymphocytes)
  - melanocytes, sex cord stroma, adrenal cortex
  - sensitive (85%) and specific marker for melanomas
  - sensitivity lowest in spindle cell amelanotic melanomas
- HMB45 - Melanosomal glycoprotein gp-100
  - melanocytes, other neural crest cells
  - very specific, but less sensitive (70%) than melan A
  - sensitivity is very low in amelanotic melanomas
- S-100 - Staining is nuclear and cytoplasmic:
  - glial, ependymal cells, Schwann cells, melanocytes, dendritic cells, sweat glands of the skin, myoepithelial cells, chondrocytes, adrenal, thyroid, neuroendocrine
  - sensitive for poorly differentiated melanomas
  - approximately 90% of amelanotic melanomas

Cutaneous and Oral Melanomas

- MITF - Microphthalmia associated transcription factor
  - melanocytes
  - nuclear expression
  - nearly 100% sensitivity
  - preliminary studies detected it in soft tissue sarcomas
- TRP-2 - Melanosomal glycoprotein gp-100
  - melanocytes, other neural crest cells
  - very specific, but less sensitive (70%) than melan A
  - sensitivity is very low in amelanotic melanomas
- PNL-2 - Staining is nuclear and cytoplasmic:
  - detects normal and neoplastic melanocytes
  - sensitivity superior to Melan-A and MITF, similar to S-100



PNL-2

Study Design

- 50 canine oral amelanotic melanomas
  - location within the oral cavity or on the lip
  - evidence of epitheliotropism or at least junctional activity
  - minimal to no melanin pigment
  - cellular morphology suggestive of melanocytic origin (polygonal to spindle shaped cells).
- 10 well-differentiated, well pigmented canine oral melanomas (positive controls)
- 10 cases of well-differentiated, subcutaneous soft tissue spindle cell sarcomas (negative controls)
- IHC for Melan-A, HMB-45, MITF, S-100 , PNL-2, tyrosinase, tryptophane hydroxylase, tyrosine hydroxylase, and TRP-1 and TRP-2

Preliminary Data

- Melan A, HMB45, PNL-2, TRP-2 are highly specific for canine melanomas
- S-100, MITF, PNL-2, TRP-2 and Melan A have high sensitivity for canine melanomas
- S-100 and MITF are less specific
- Cocktail of Melan A, PNL-2 and TRP-2 will detect approximately 95% of oral amelanotic melanomas
- Use alkaline phosphatase with red chromogen for nuclear markers and pigmented tumors
- Bleach after the immunostaining
- Strongest expression in cells with junctional activity
- Always sample overlying epithelium (non-ulcerated tumor portion), more differentiated cells

Canine Melanocytic Neoplasia

- Haired skin: Most commonly benign
- Oral, subungual: Most commonly malignant
- Mechanisms underlying these differing clinical outcomes are not understood

Oncogene-induced Senescence Accounts for the Biological Behavior of Benign Canine Melanocytic Neoplasia

- Some benign tumors rarely ever undergo malignant transformation - mechanism?
- For some tumors it is difficult to distinguish benign from malignant lesions - markers?
- Mechanisms that limit growth may be of future therapeutic utility

Normal Cells

- Replicative senescence
- Senescence: irreversible exit from the cell cycle with preservation of metabolic function
  - Shortening of telomeres with each cell division
  - Critical length – triggers cell cycle arrest
  - Can be prevented by over-expression of telomerase (stops telomere shortening)

Cancer cells: limits on proliferation?

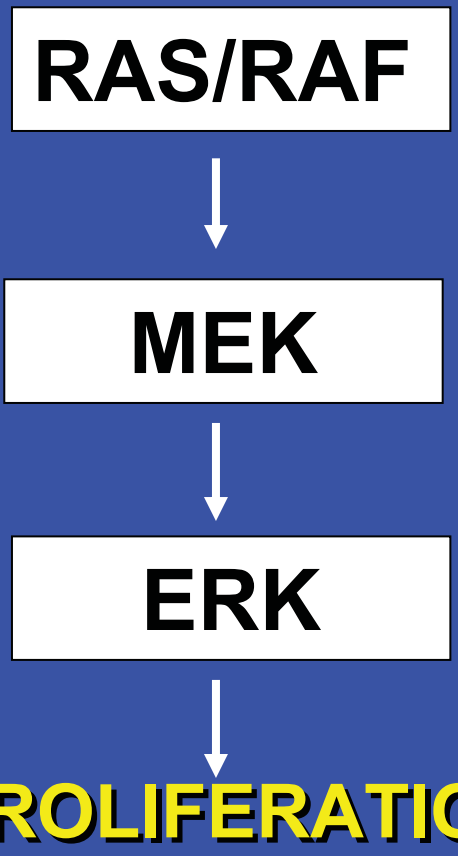
- Ischemia/hypoxia - necrosis
- DNA damage – cell cycle arrest (p53)– apoptosis
- Replicative senescence – (telomerase)
- Premature senescence:
  - Not dependent on replication number
  - Telomere-independent (telomerase does not prevent)
  - Specifically induced by certain oncogenes

Overexpression of an Oncogene: RAS Proliferation Signal

BRAF, HRAS mutations:
Constitutive activation

Intact tumor suppressor pathway: p16INK4A

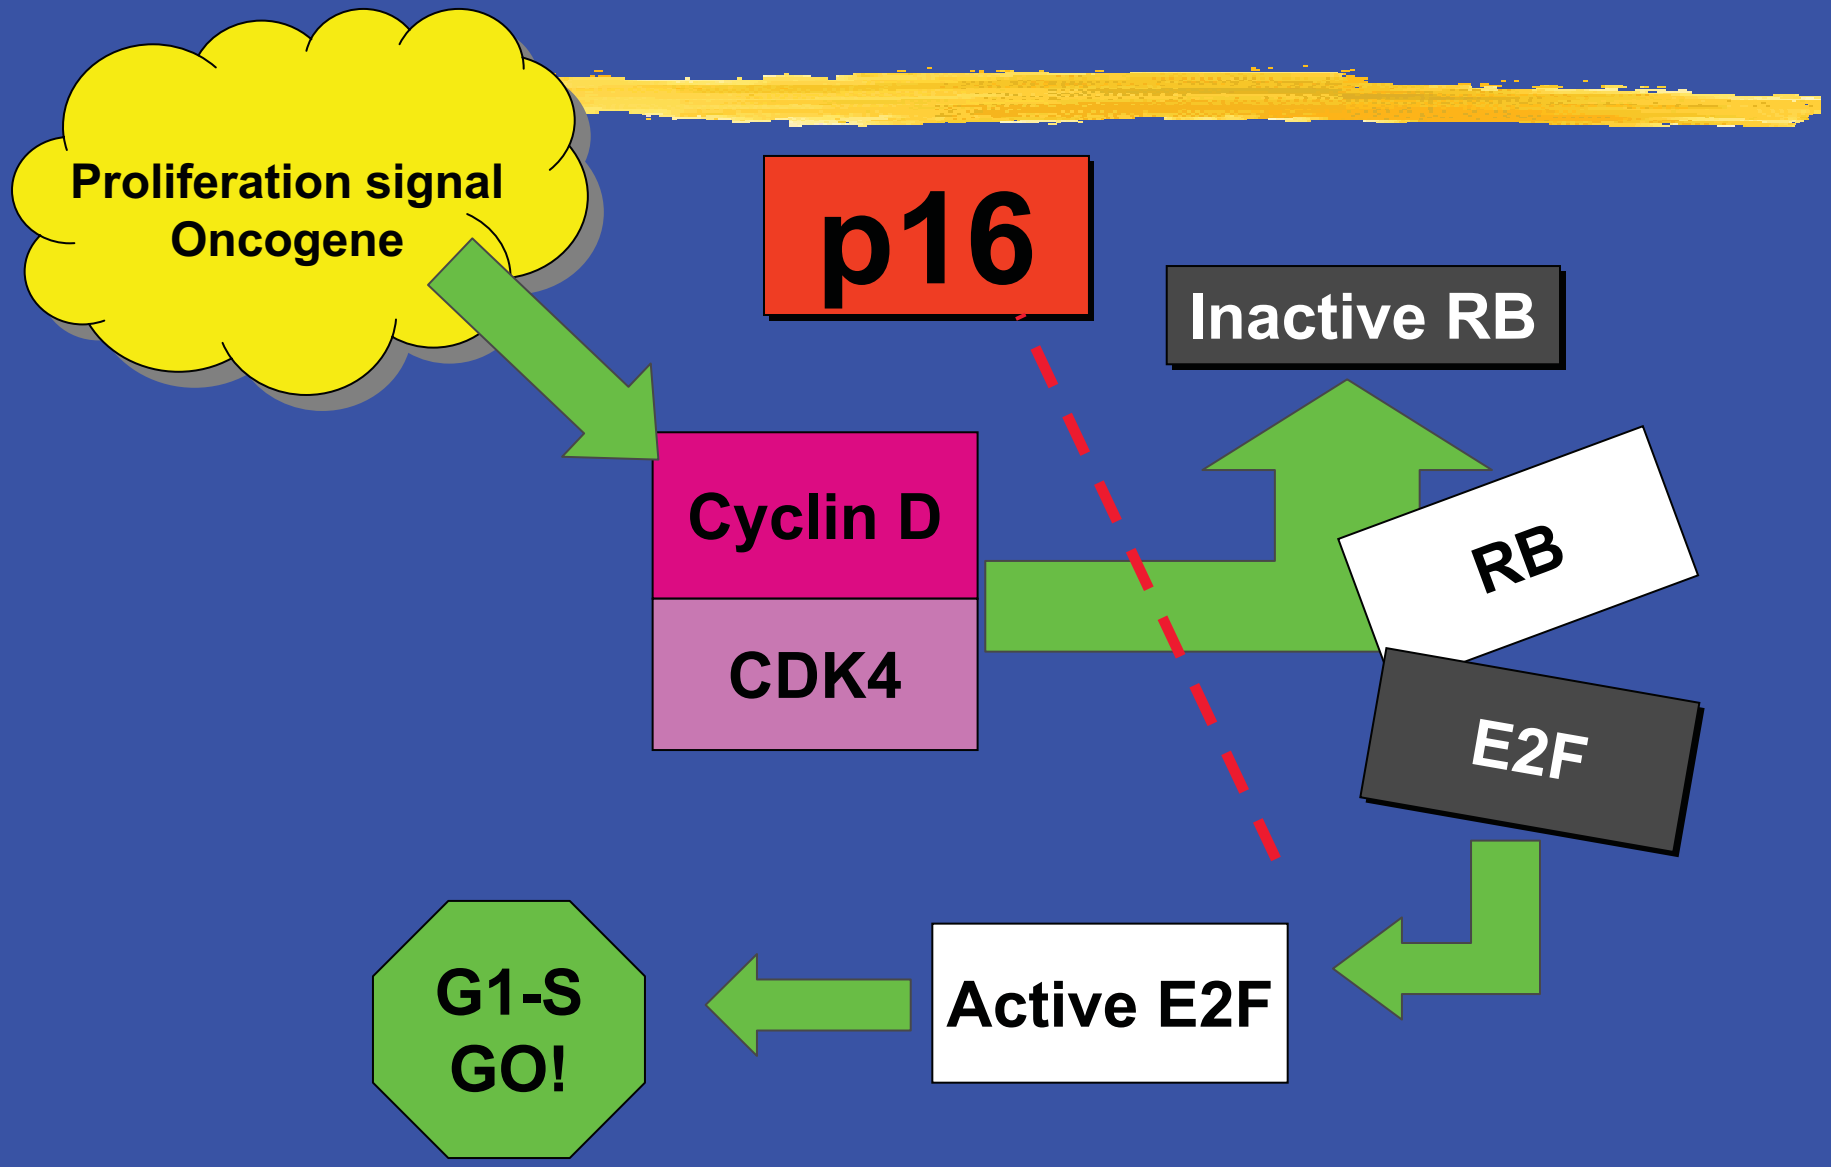
- Key role in regulation of the cell cycle
- Increased expression in NORMAL senescent cells
- Increased expression in some benign tumors
- Expression induced by overexpression of certain oncogenes



MAP kinase pathway

***BUT… benign melanomas eventually STOP proliferating!!!

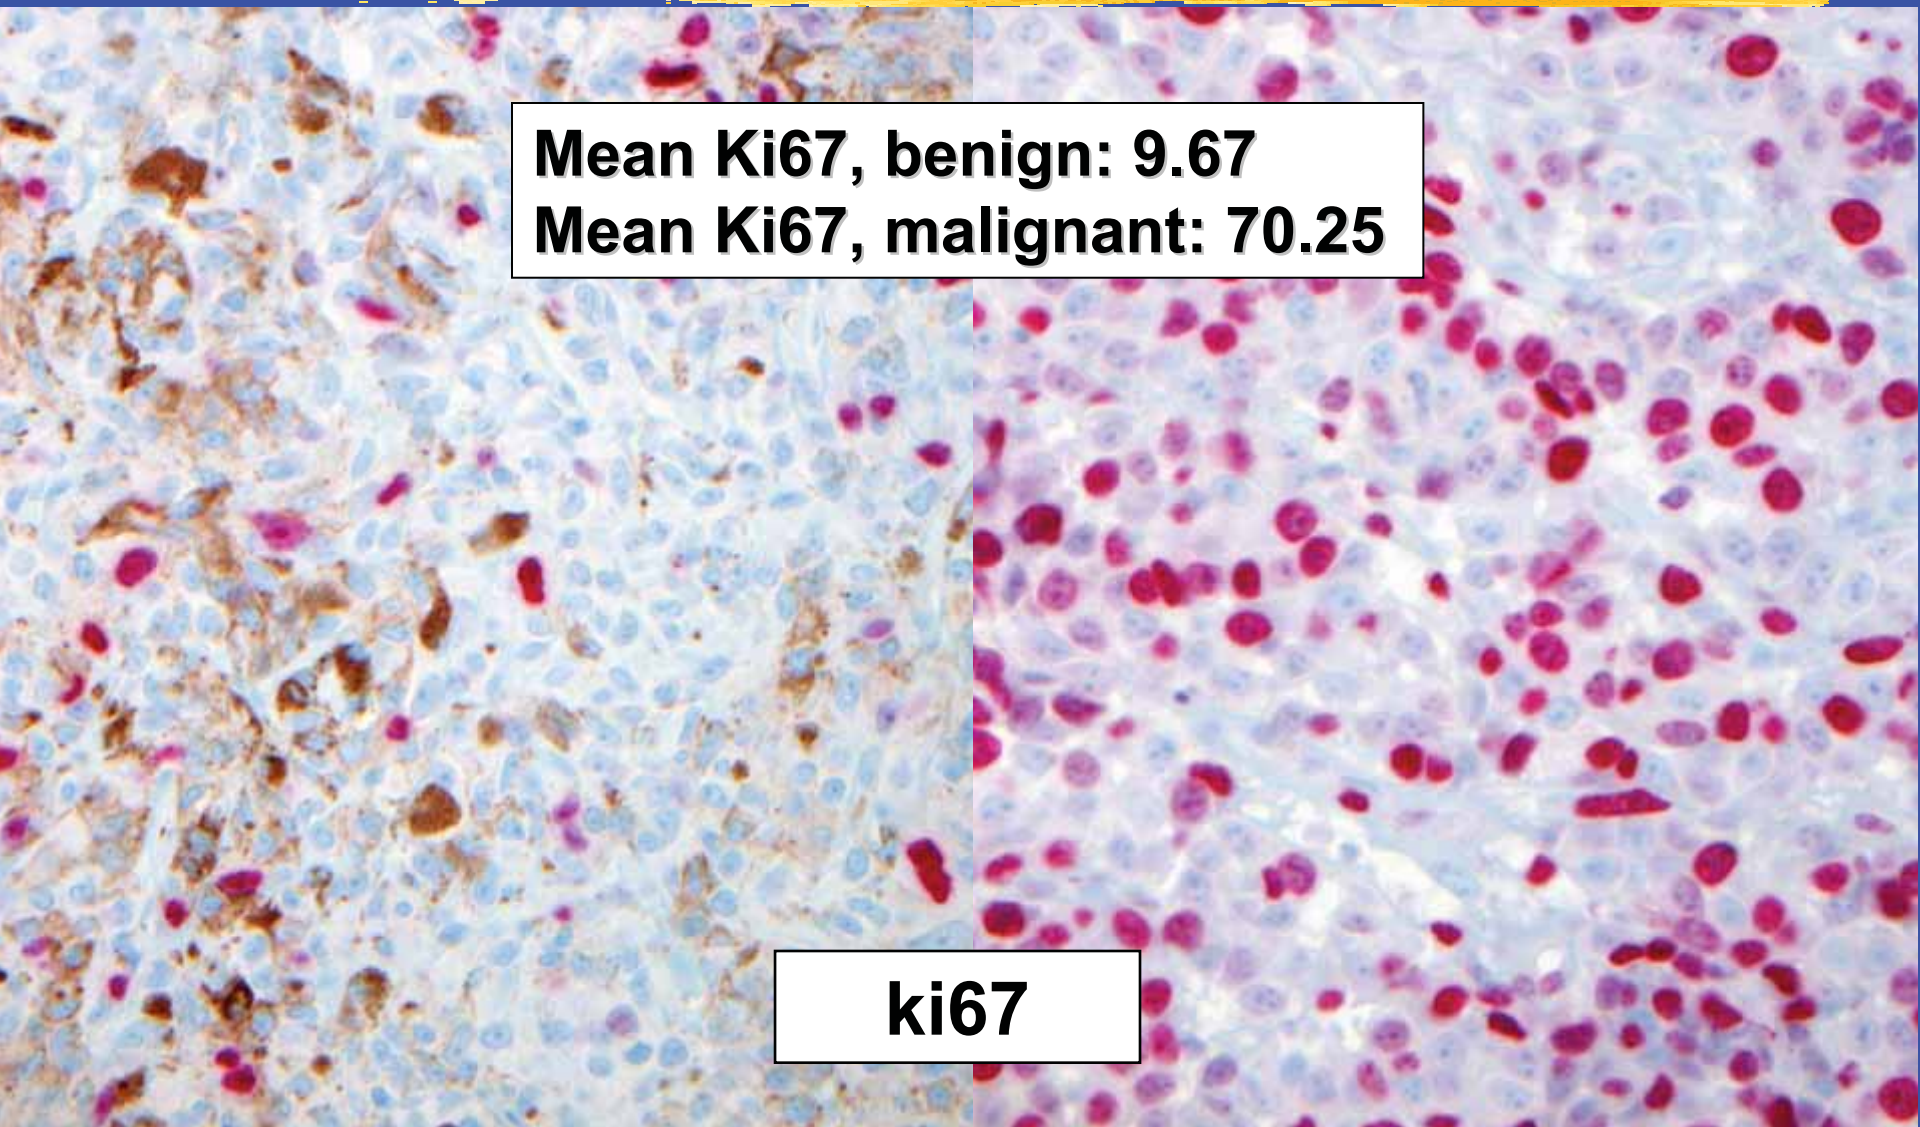
Control of the Cell Cycle at G1-S



Established Markers of Oncogene-Induced Senescence

1. Activation of an oncogene
   - *N-Ras* mutations
   - *B-Raf* mutations
   - H-Ras mutations/copy number increase
   - ERK phosphorylation
2. Total or near-total loss of proliferation
3. Intact tumor suppressor pathway
   - p16
   - p53
4. Senescence-associated β-galactosidase
   - Need frozen sections

Benign Melanocytic Lesions Have Lower Proliferation Markers than Malignant Lesions



Soft Tissue Sarcomas

- Vimentin +
- Fibrosarcomas: SMA +/-, Desmin -
- Rhabdomyosarcoma: Desmin +, SMA -, MSA + myoglobin +
- Leiomyosarcoma: Desmin +/-, SMA +, MSA +
- PNST: S-100 +, PGP 9.5 +/-
- Liposarcoma: S-100 +
- Hemangiopericytoma: Desmin +/-, MSA +/- , S-100 -, Factor 8 -
- MFH: Desmin +/-, MSA +/-
  - Differentiate from histiocytic sarcomas: CD18, CD45

Non-angimatous, Non-lymphomatous Gastrointestinal Sarcomas

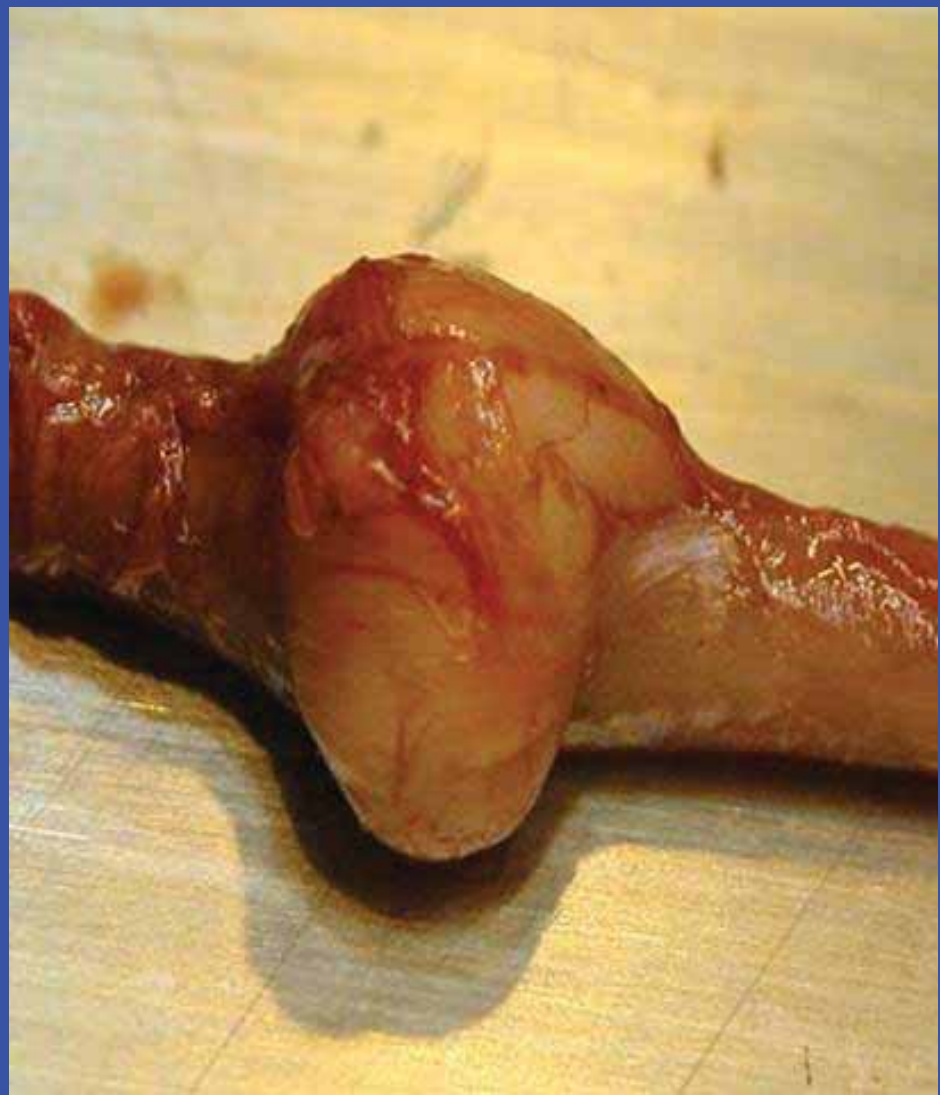
Non-angimatous, Non-lymphomatous Gastrointestinal Sarcomas

- Included:
  - Fibrosarcoma
  - Leiomyosarcoma
  - Neurofibrosarcoma
  - Spindle cell sarcoma
- Originate from the wall of the gastrointestinal tract
- Mesenchymal/spindle cells
- Smooth Muscle Origin
  - Most common in dogs



What are GIST?

- Distinct tumor entity
  - Histologic characteristics
  - Express tyrosine kinase KIT (CD117)
- Interstitial Cells of Cajal
  - Pacemaker for autonomic movement
- Prognosis
  - Invasive
  - Metastasis

Study Population

- 41 non-angiomatous, non-lymphomatous gastrointestinal mesenchymal sarcomas
- Leiomyosarcoma, fibrosarcoma, anaplastic sarcoma, spindle cell sarcoma
- Leiomyomas and other benign tumors excluded from study population

Study Design

- Histochemical Staining
  - Cellular pattern
  - Cell morphology
  - Evidence of vascular/lymphatic invasion
  - Necrosis
- Immunohistochemistry
- DNA isolation/amplification
  - Polymerase Chain Reaction
  - Sequencing and sequence analysis

Immunohistochemistry

- KIT
- Vimentin
- Desmin
- Smooth Muscle Actin (SMA)
- S-100
- Pgp 9.5
- Other stains used: Factor 8 related antigen, pancytokeratin, CD18

Results

- 18 (44%) KIT positive
  - 72% female, 28% male
  - 4-15 years old, mean age ~11 years
  - Small intestine (67%)
  - 5/18 metastasis to the liver, lymph node or omentum
- Positive immunoreactivity for:
  - Vimentin: (100%)
  - S-100: 14 (78%)
  - Smooth Muscle Actin: 6 (33%)
- Categories
  - Neurogenic, Myogenic, Bi-directional

c-*kit* Mutations

- 16 of these cases yielded amplification products
- 6 cases showed activating mutations in exon 11 of JM

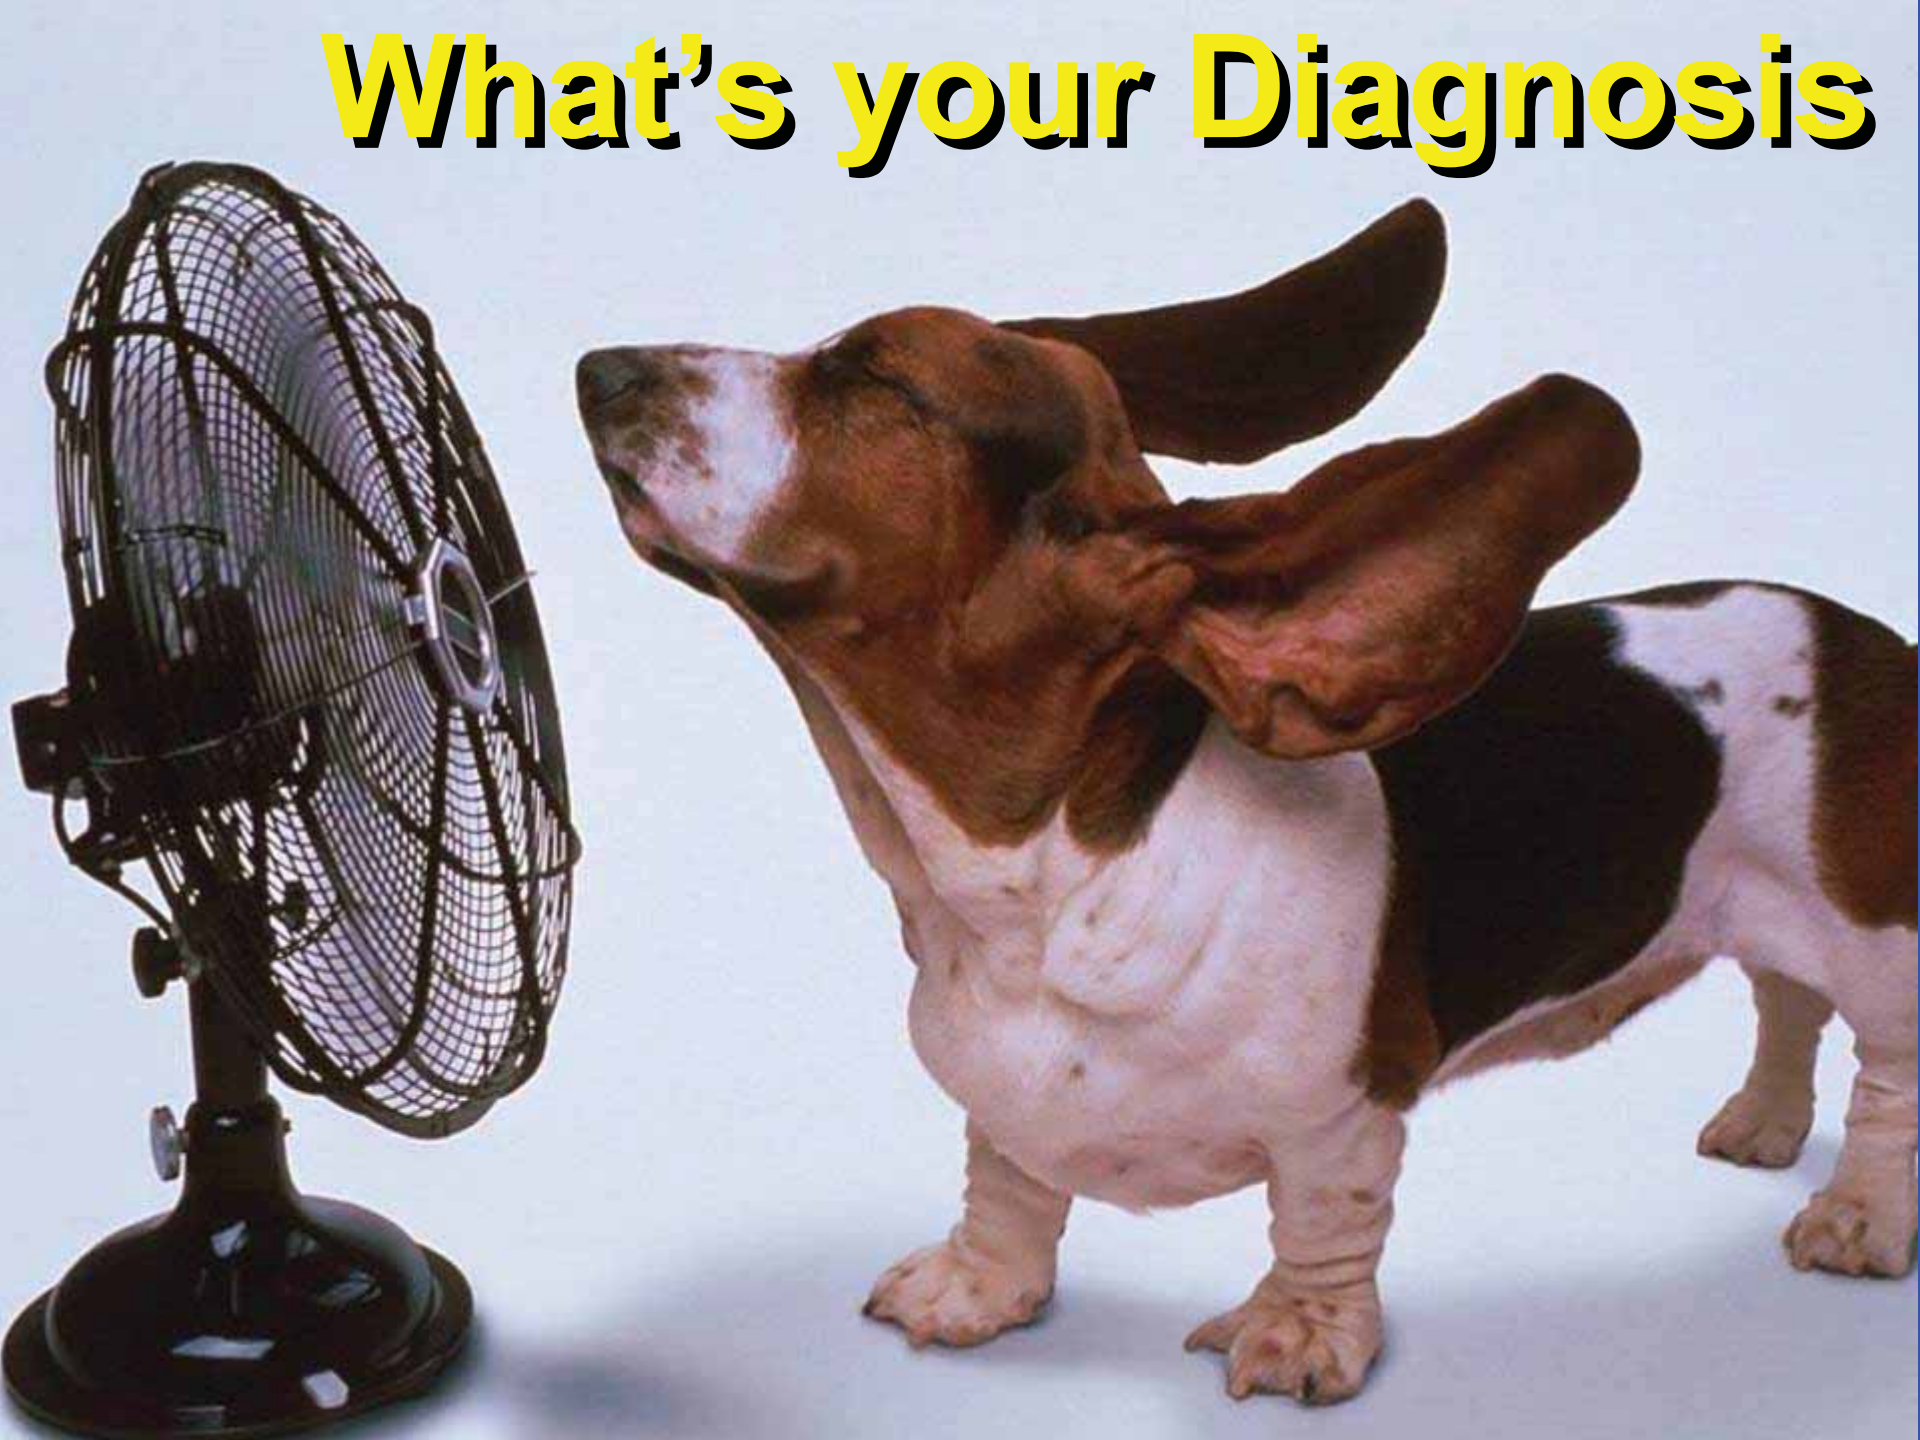
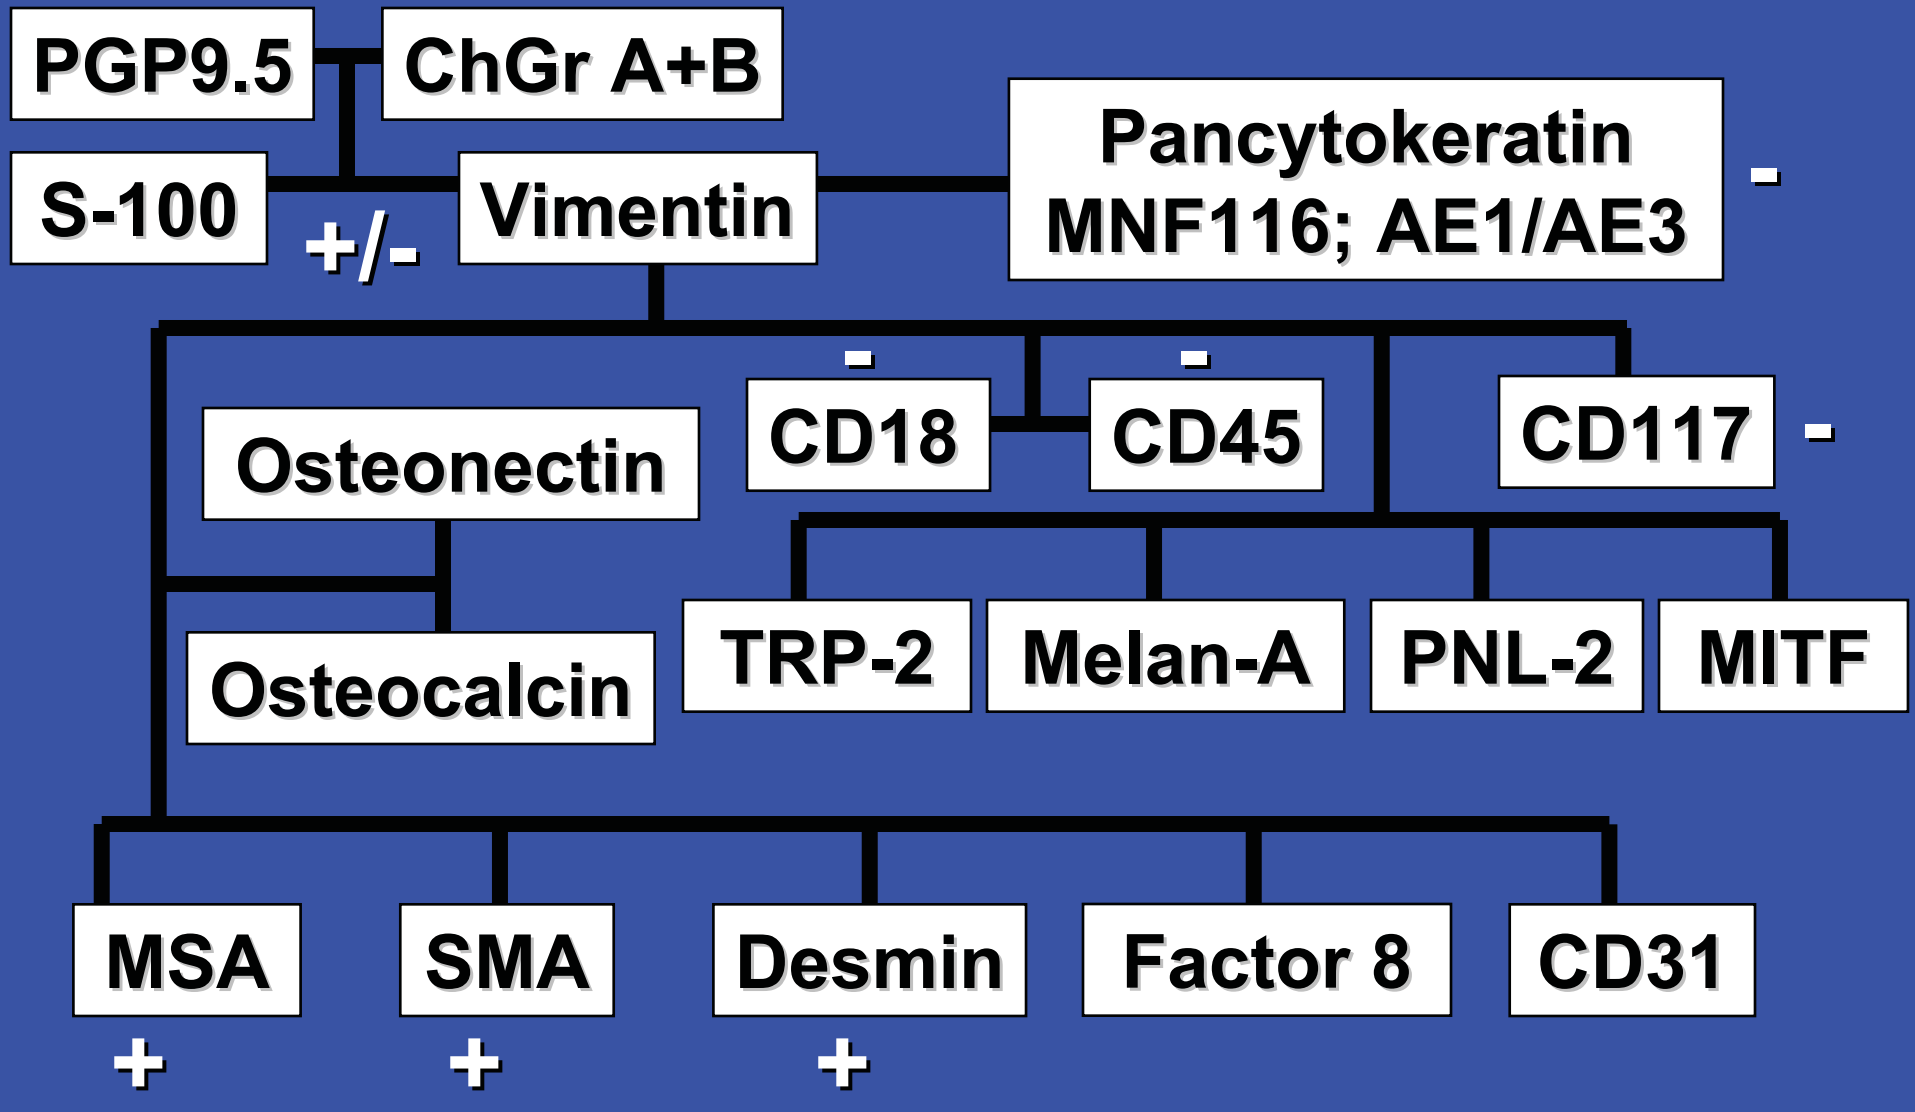
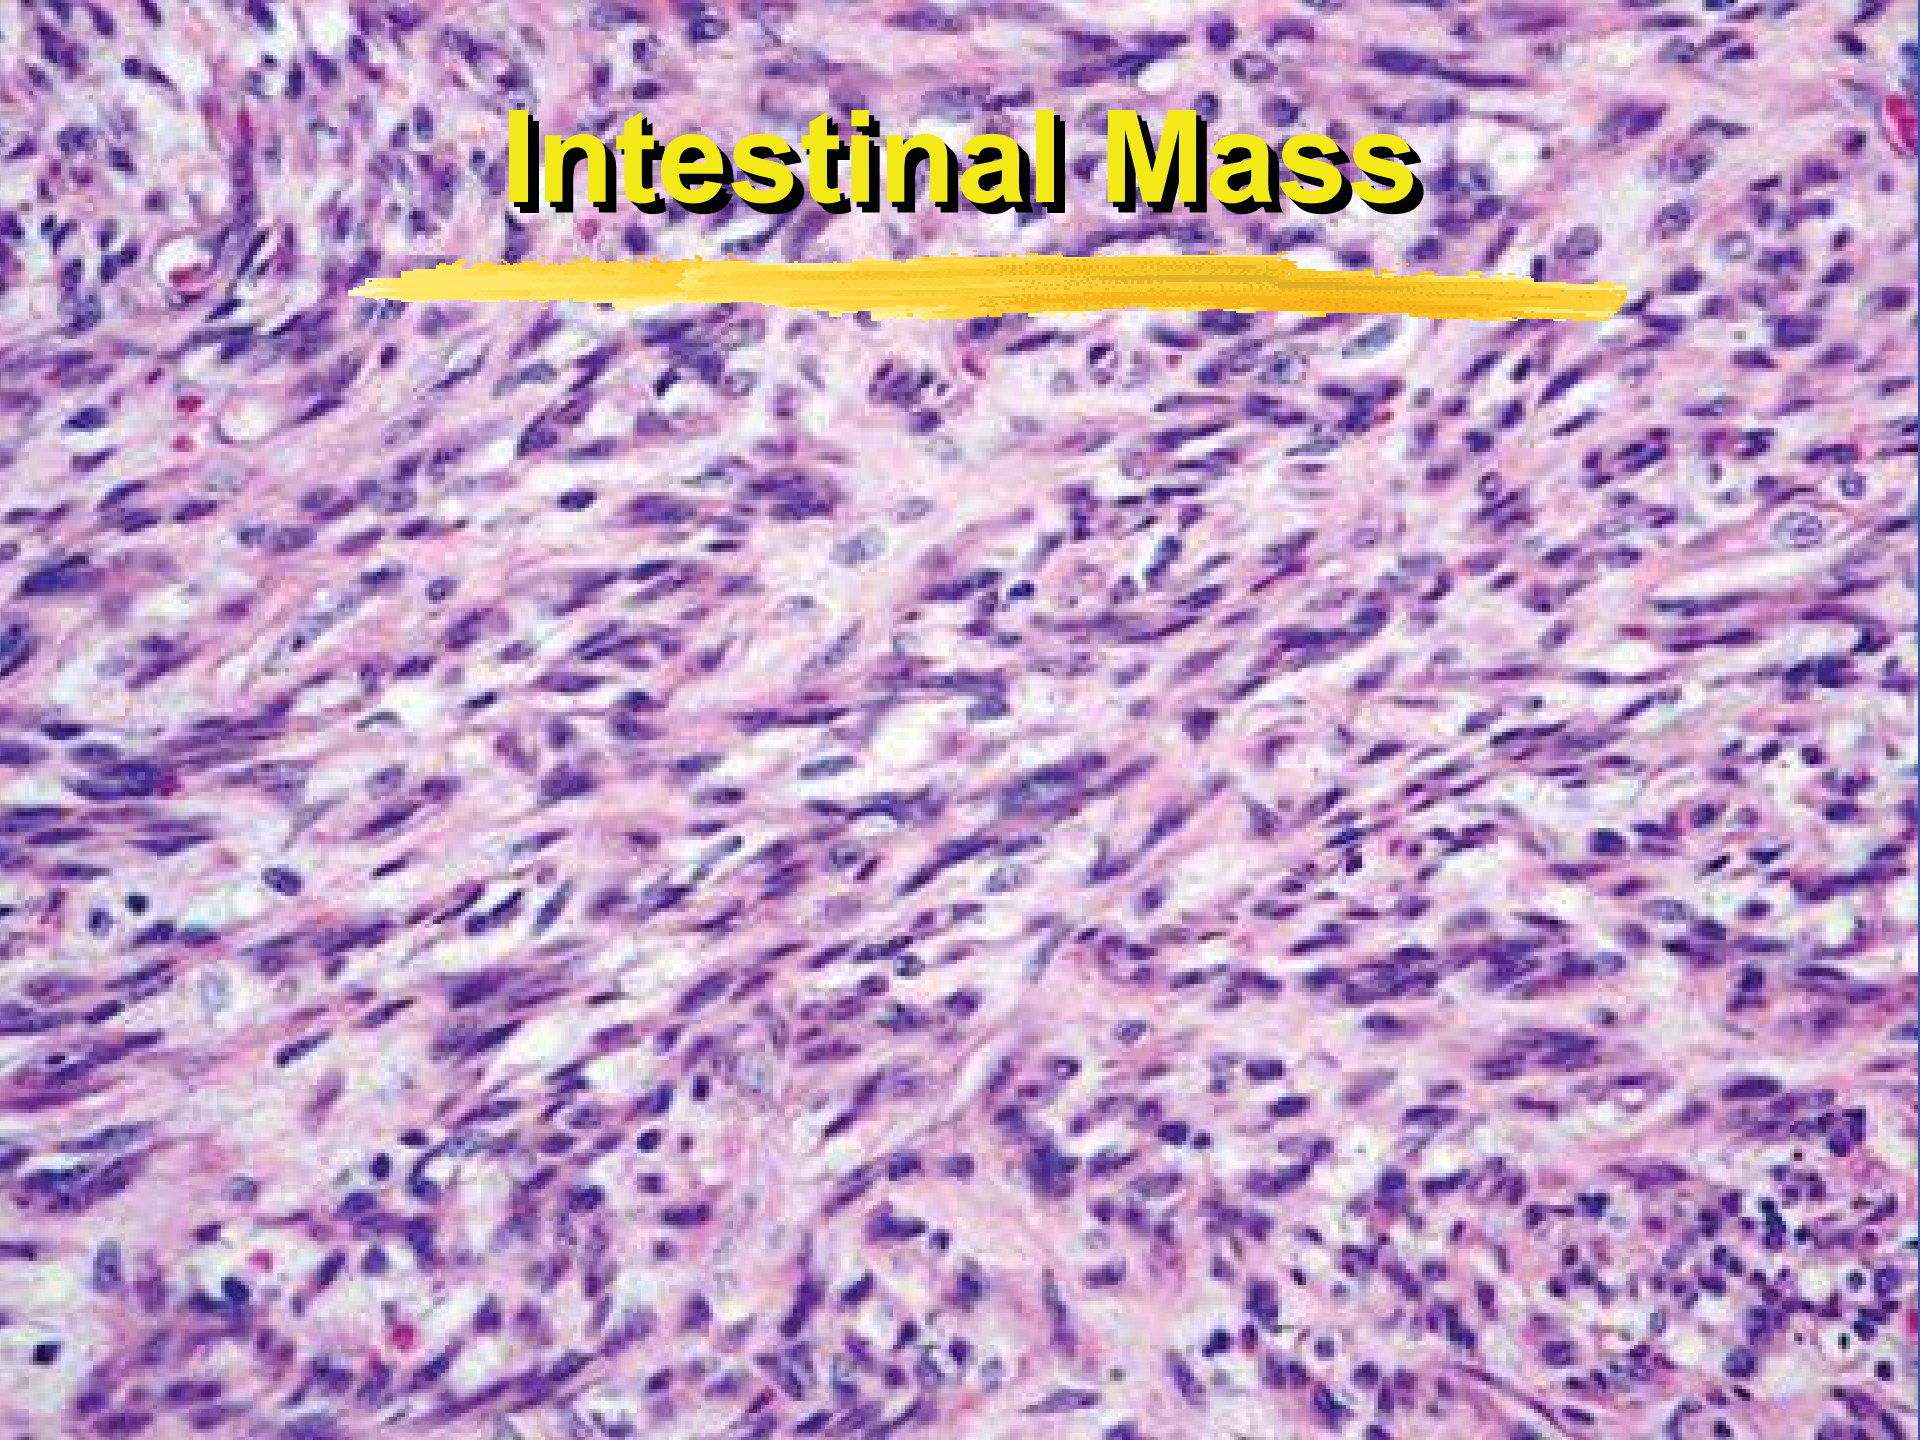
What's your Diagnosis

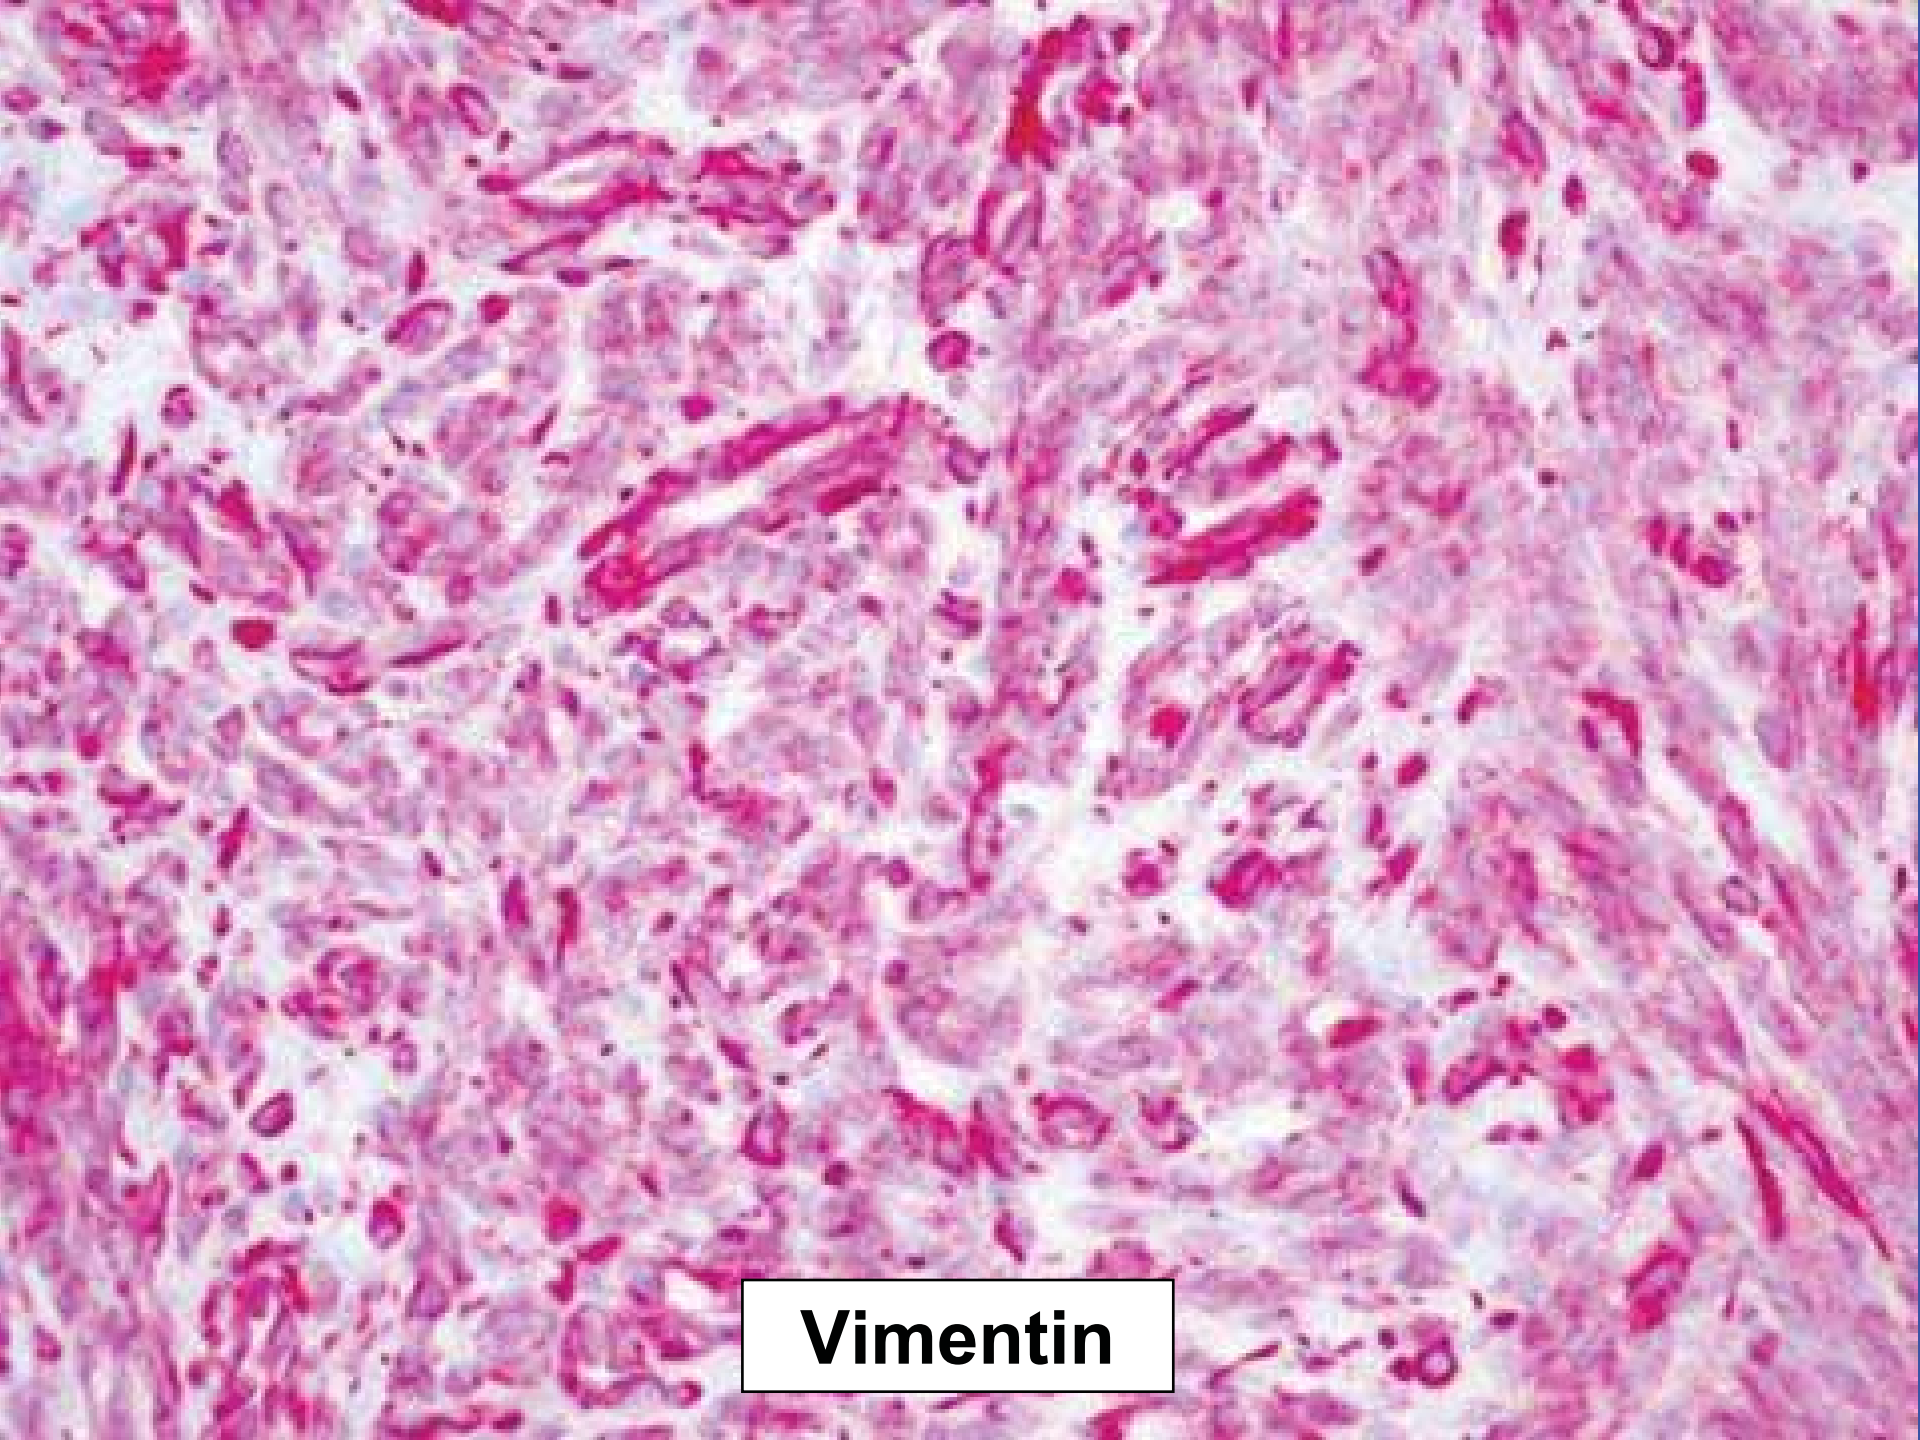


Well Differentiated Leiomyosarcoma

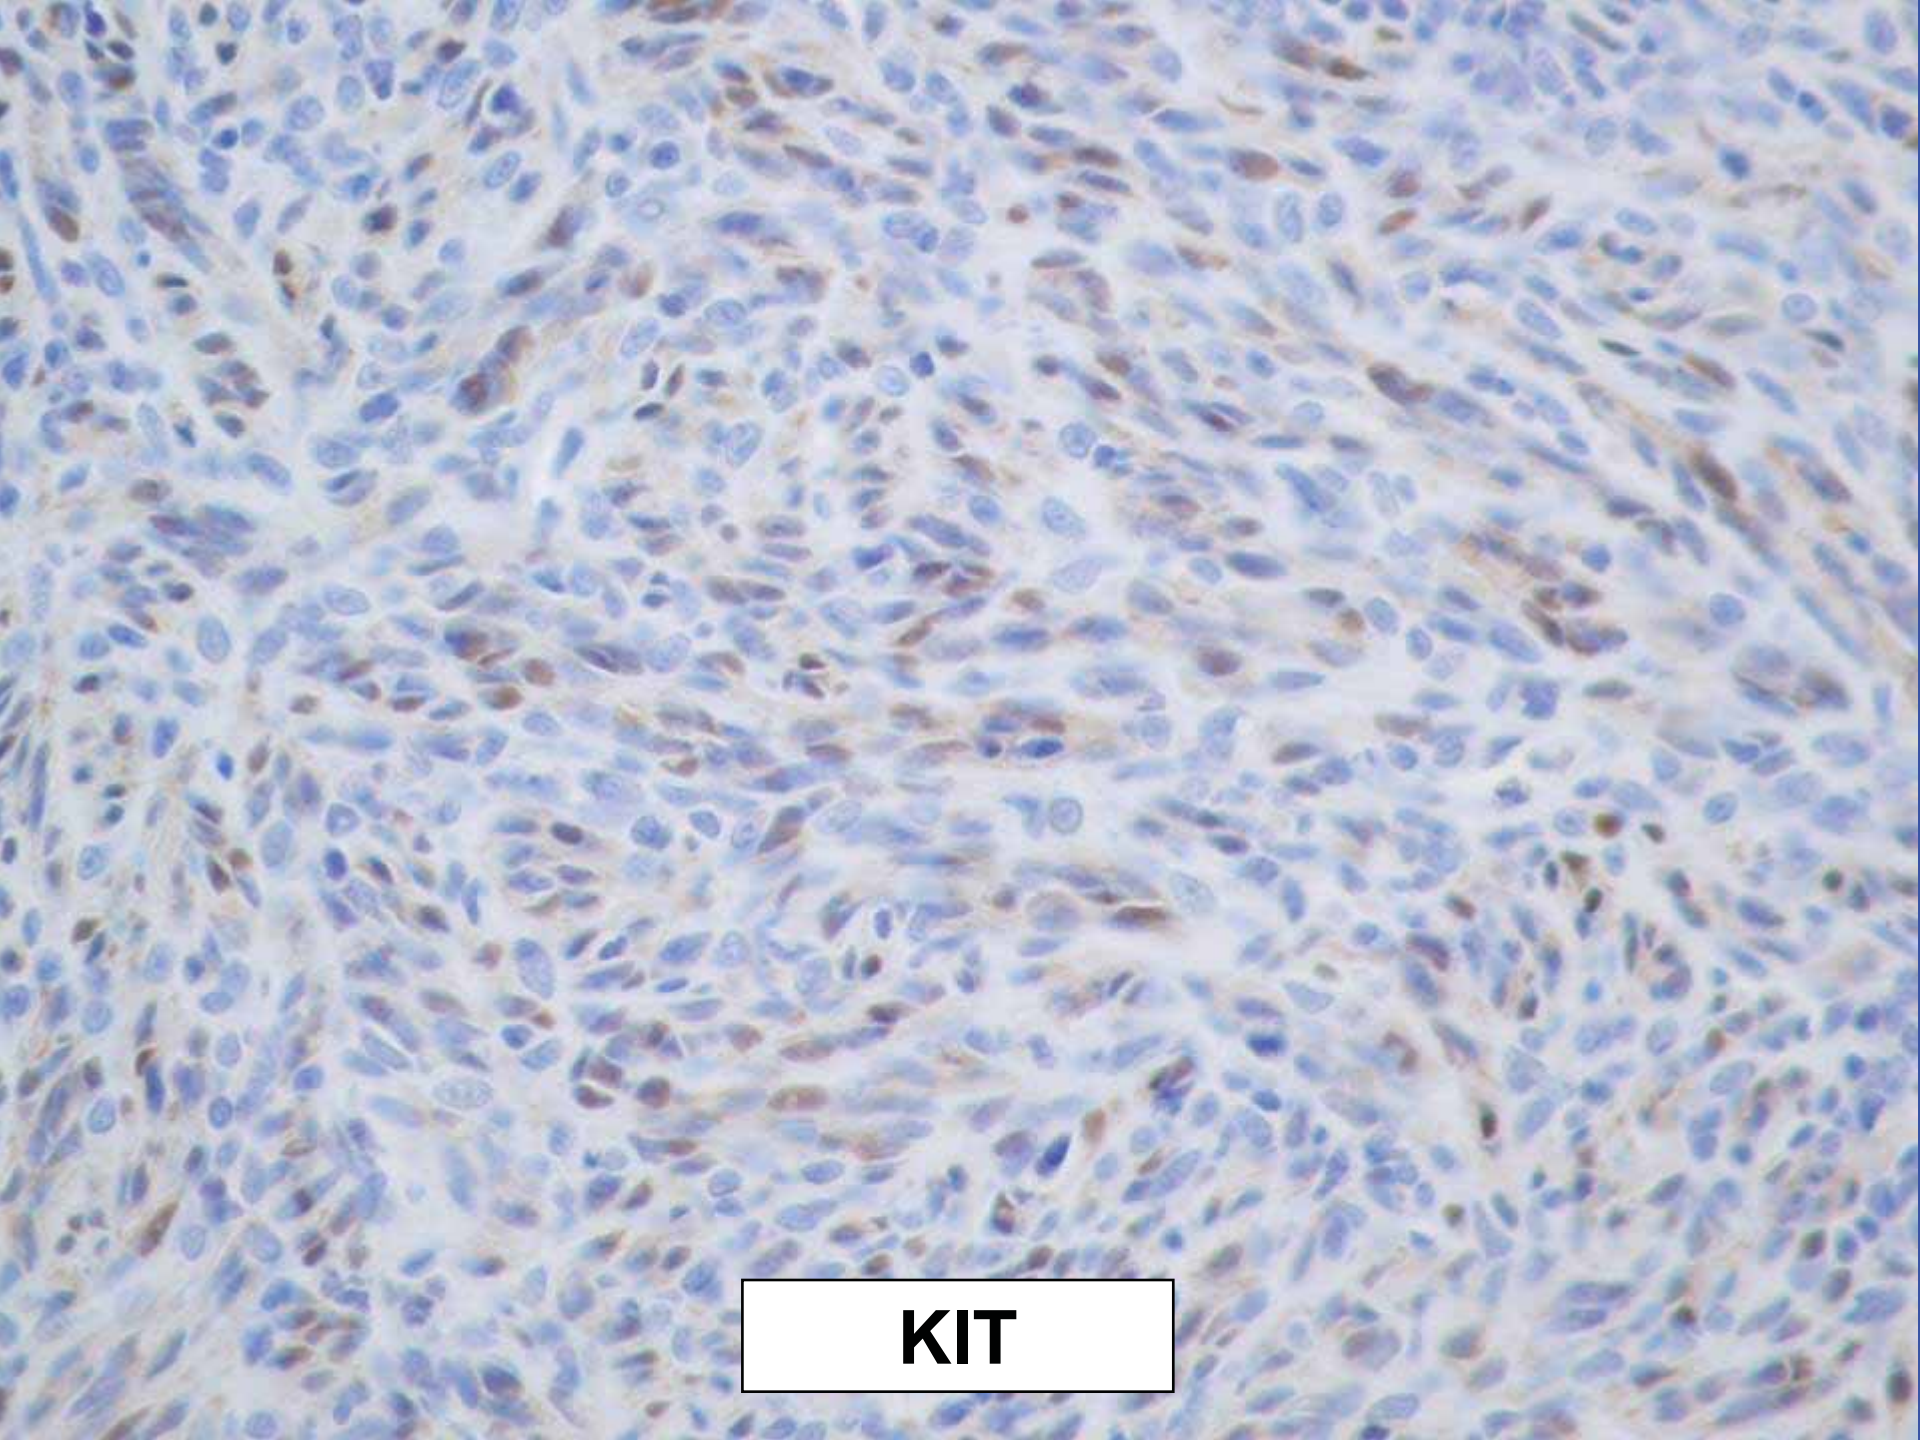


Intestinal Mass

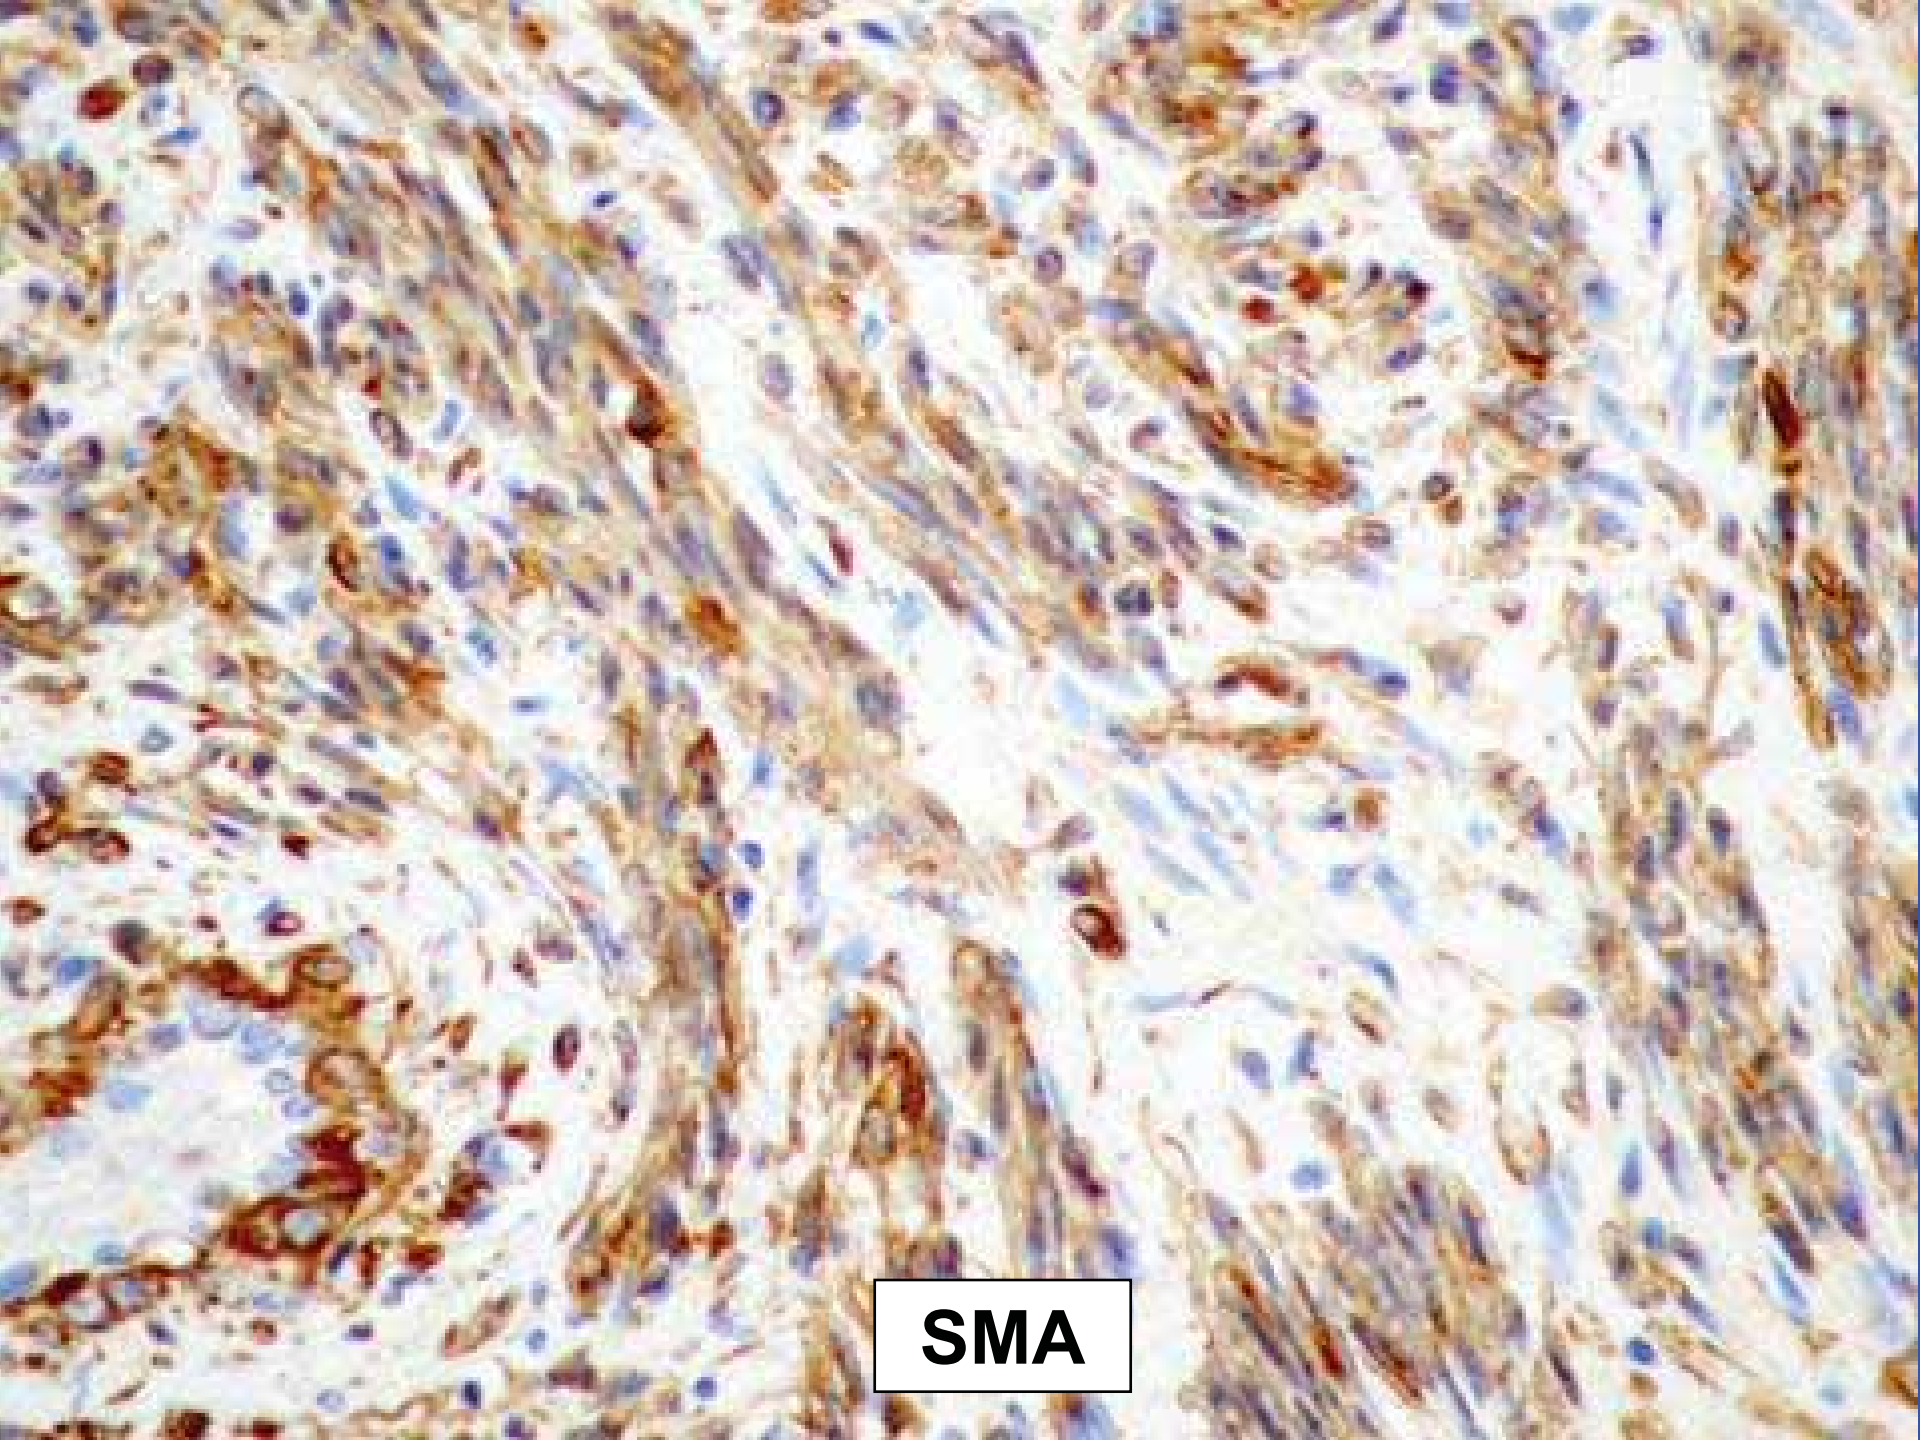




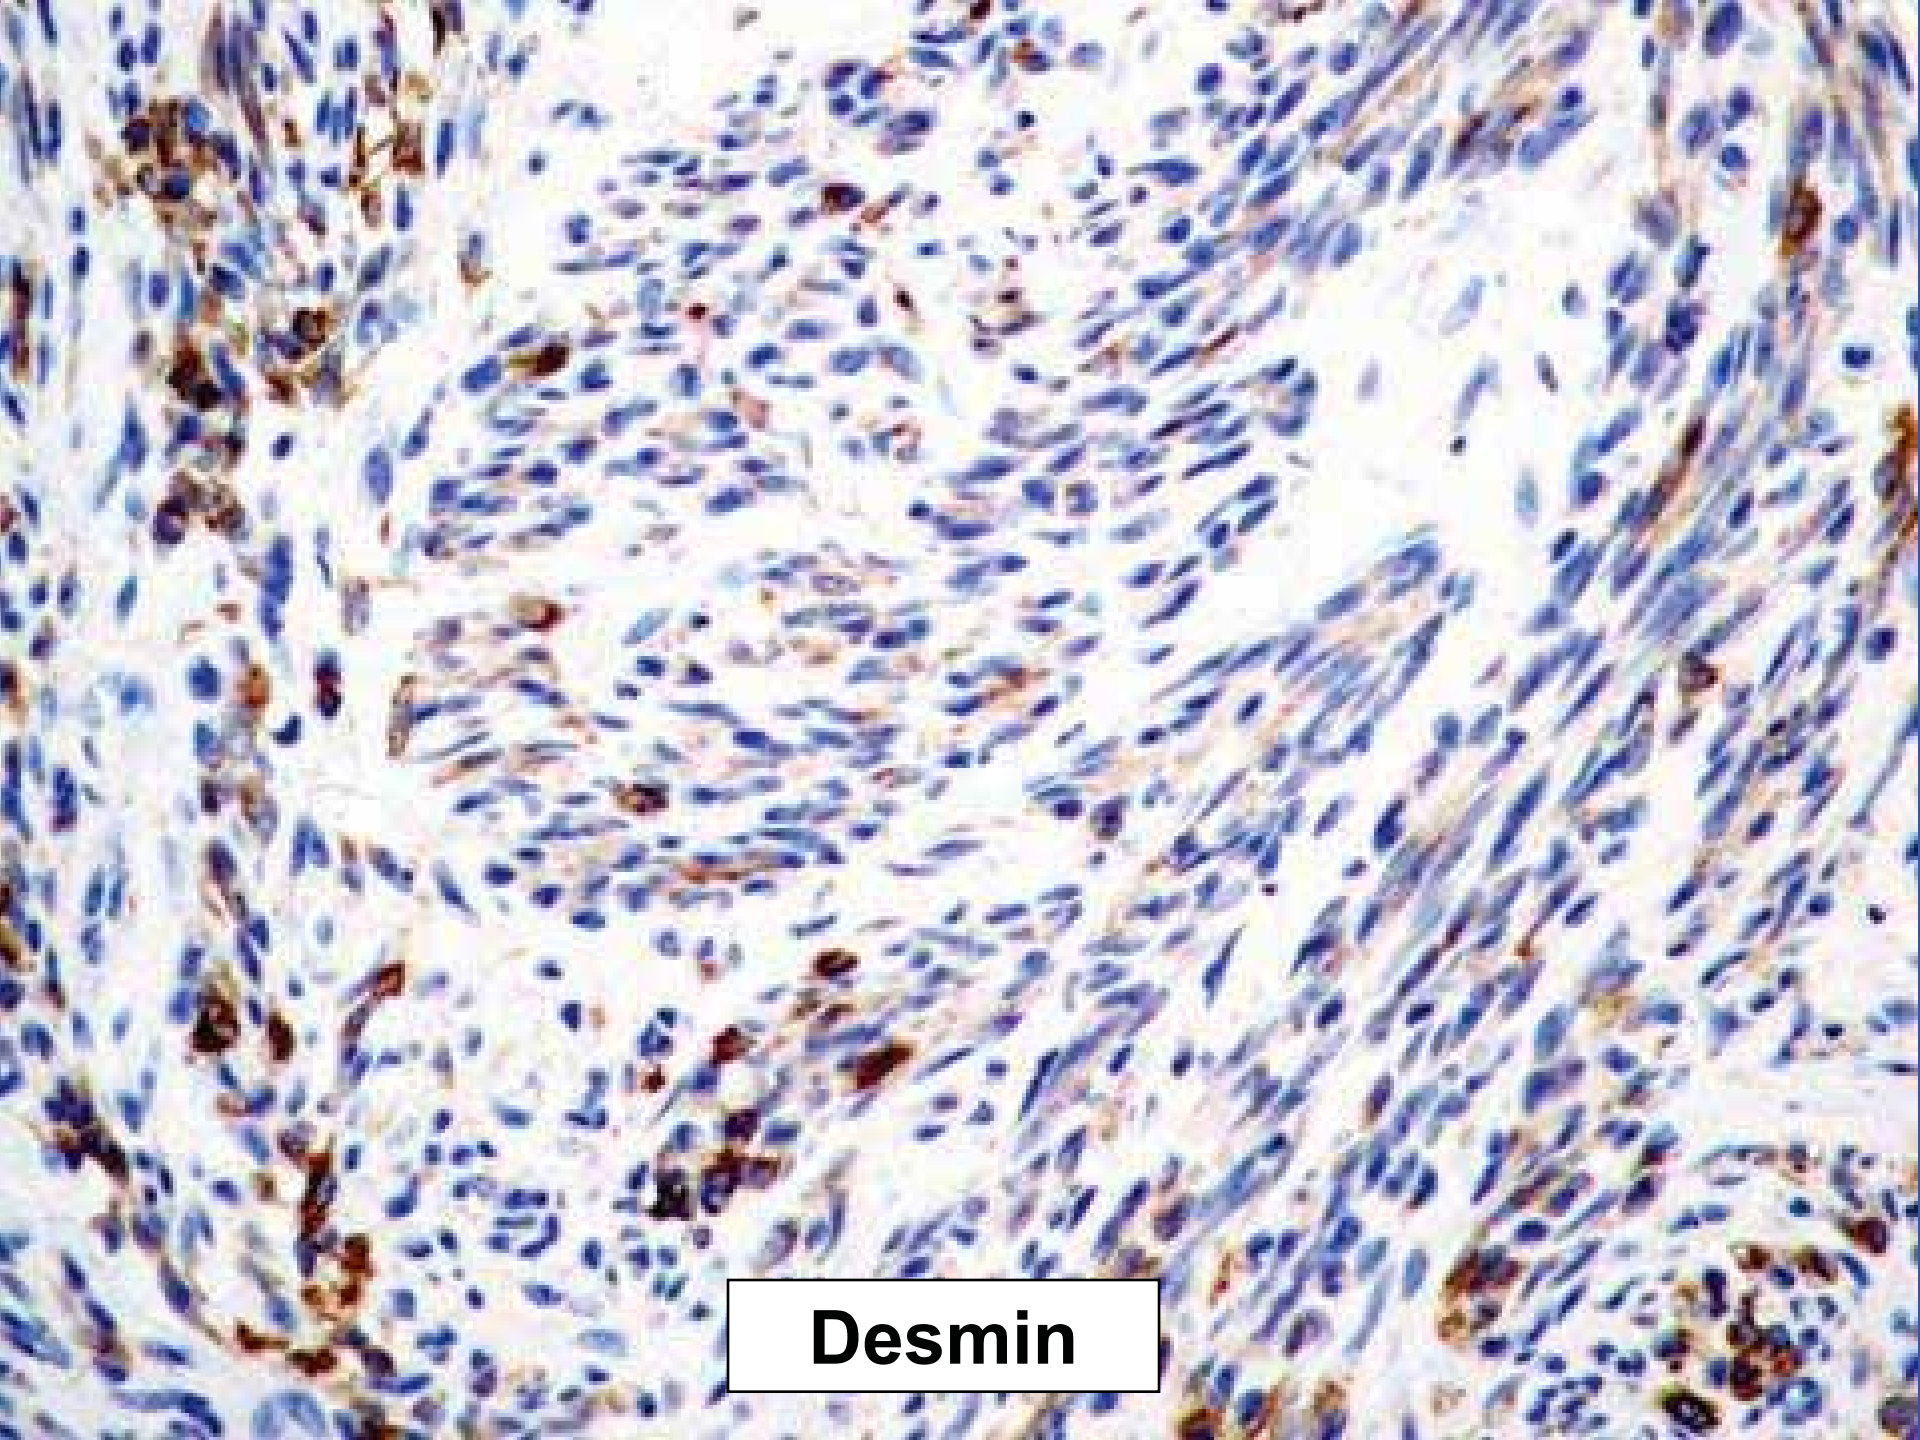
Vimentin



KIT



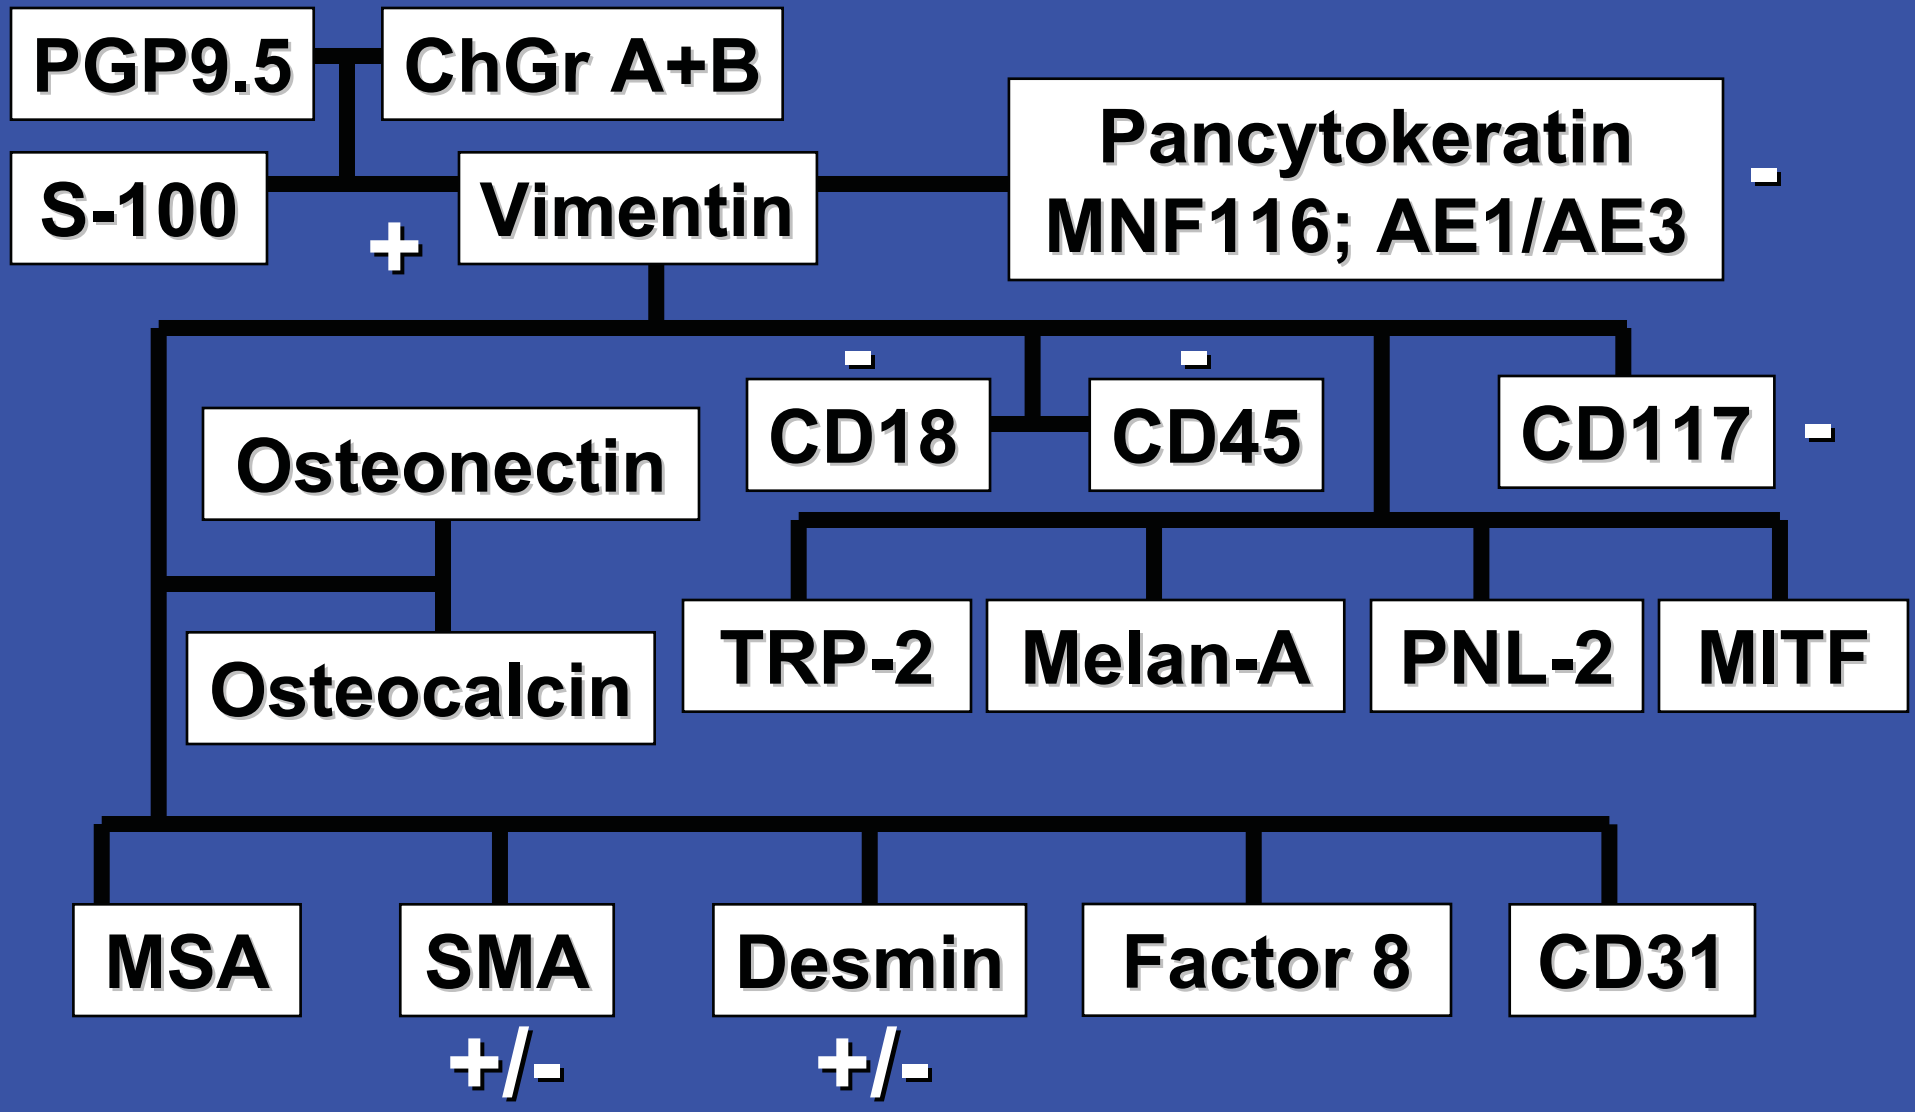
SMA



Desmin

What's your Diagnosis

Poorly Differentiated Leiomyosarcoma



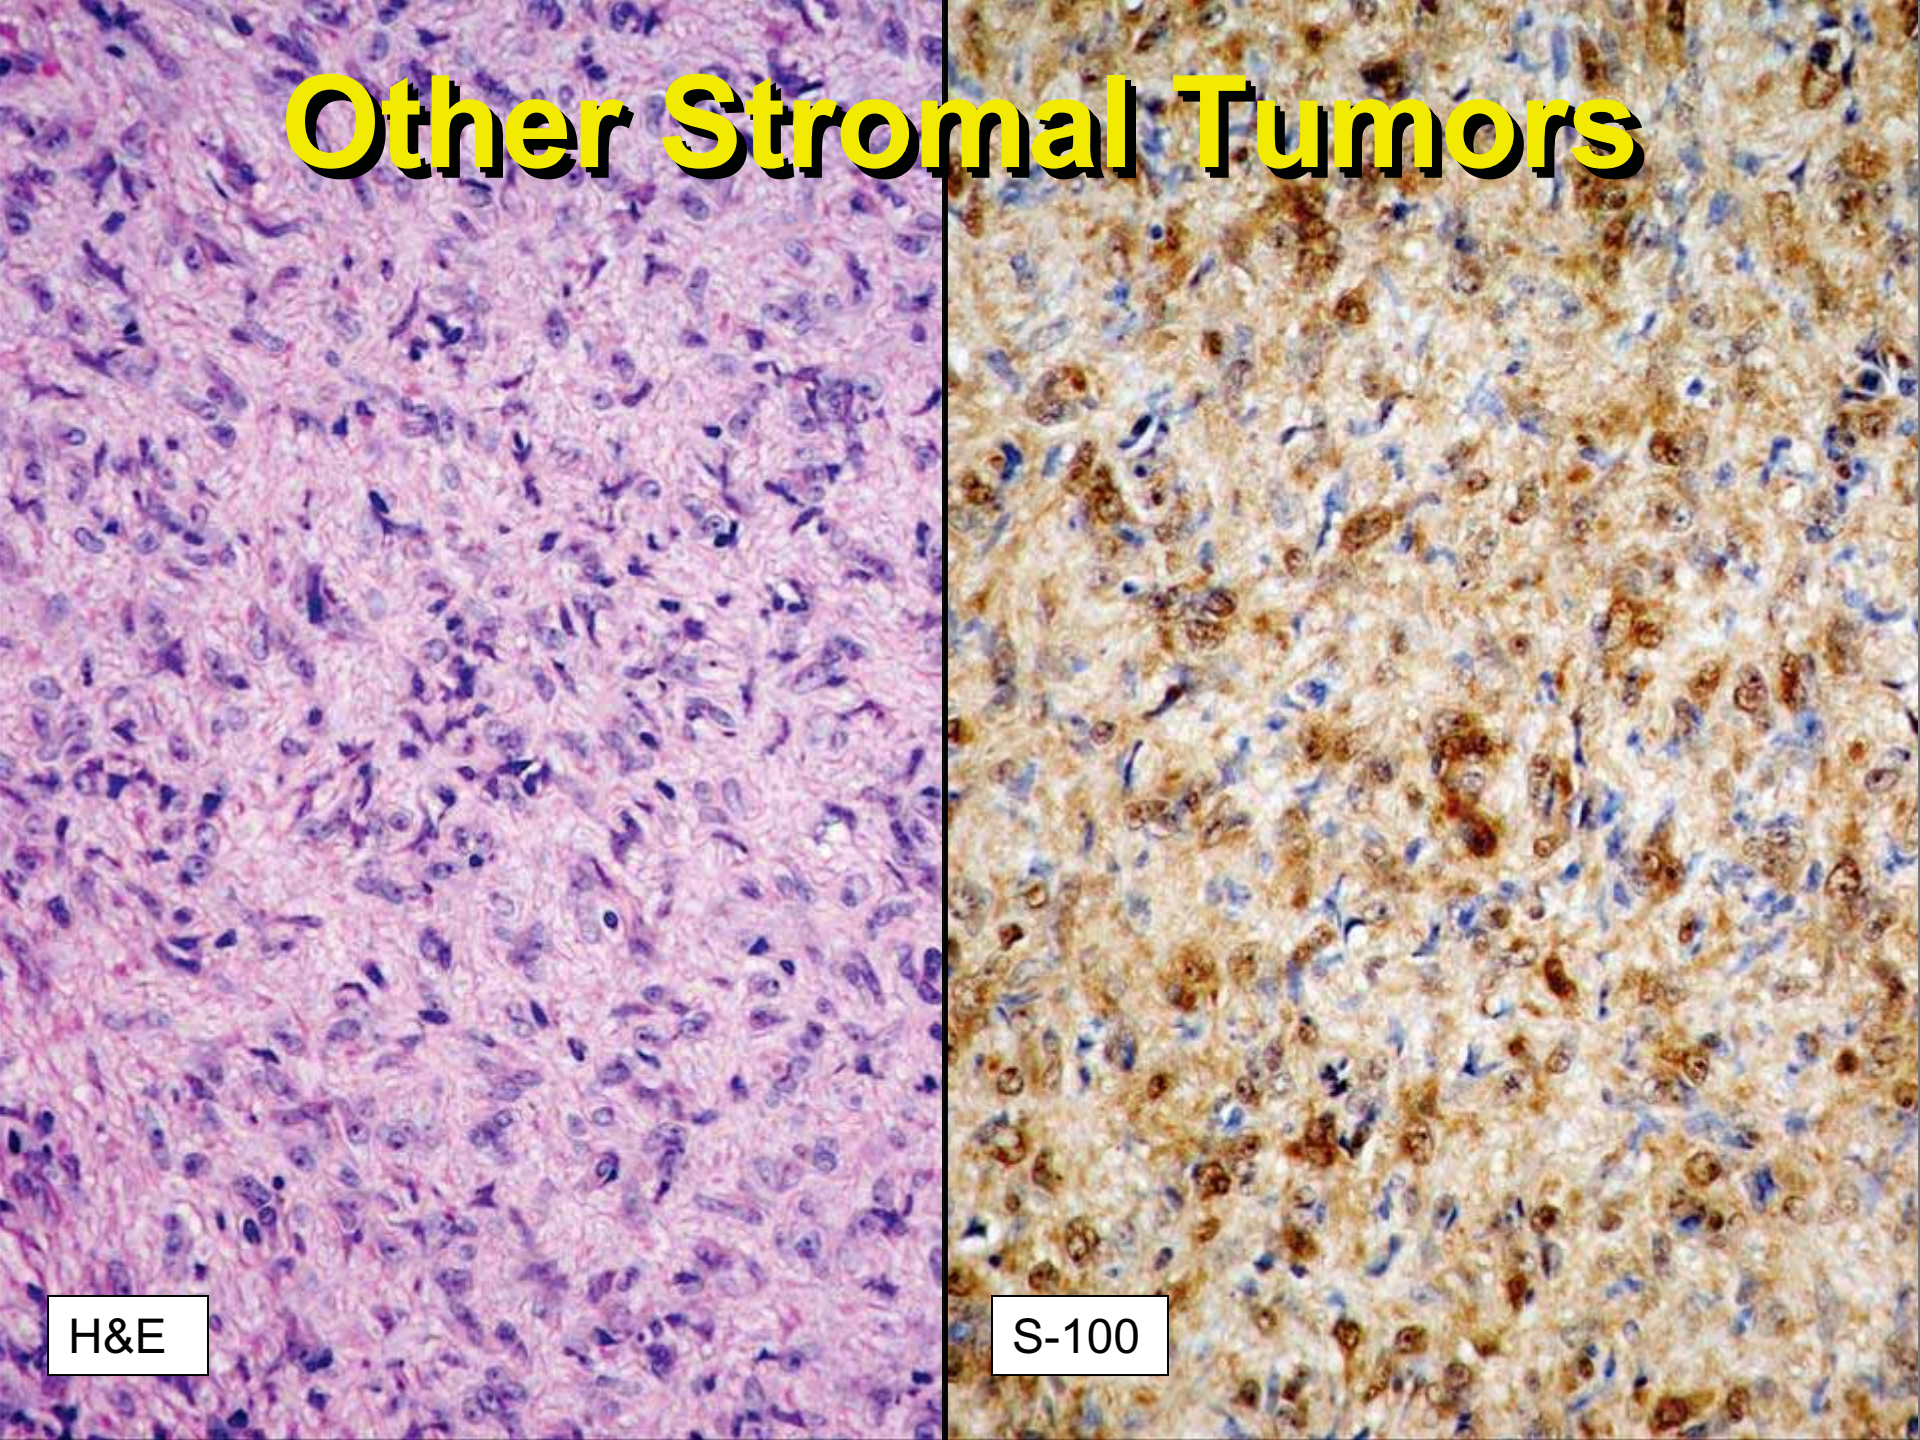
Results

- 12 (29%) Smooth Muscle Origin
  - SMA positive, KIT negative
  - 50% females, 50% males
  - 1-14 years old, mean ~7.5
  - Small intestine (92%)
  - 2/12 Metastasis (omentum)
- Positive immunoreactivity for:
  - Vimentin
    - 4 negative to minimal staining: well differentiated leiomyosarcoma
  - Desmin
  - S-100

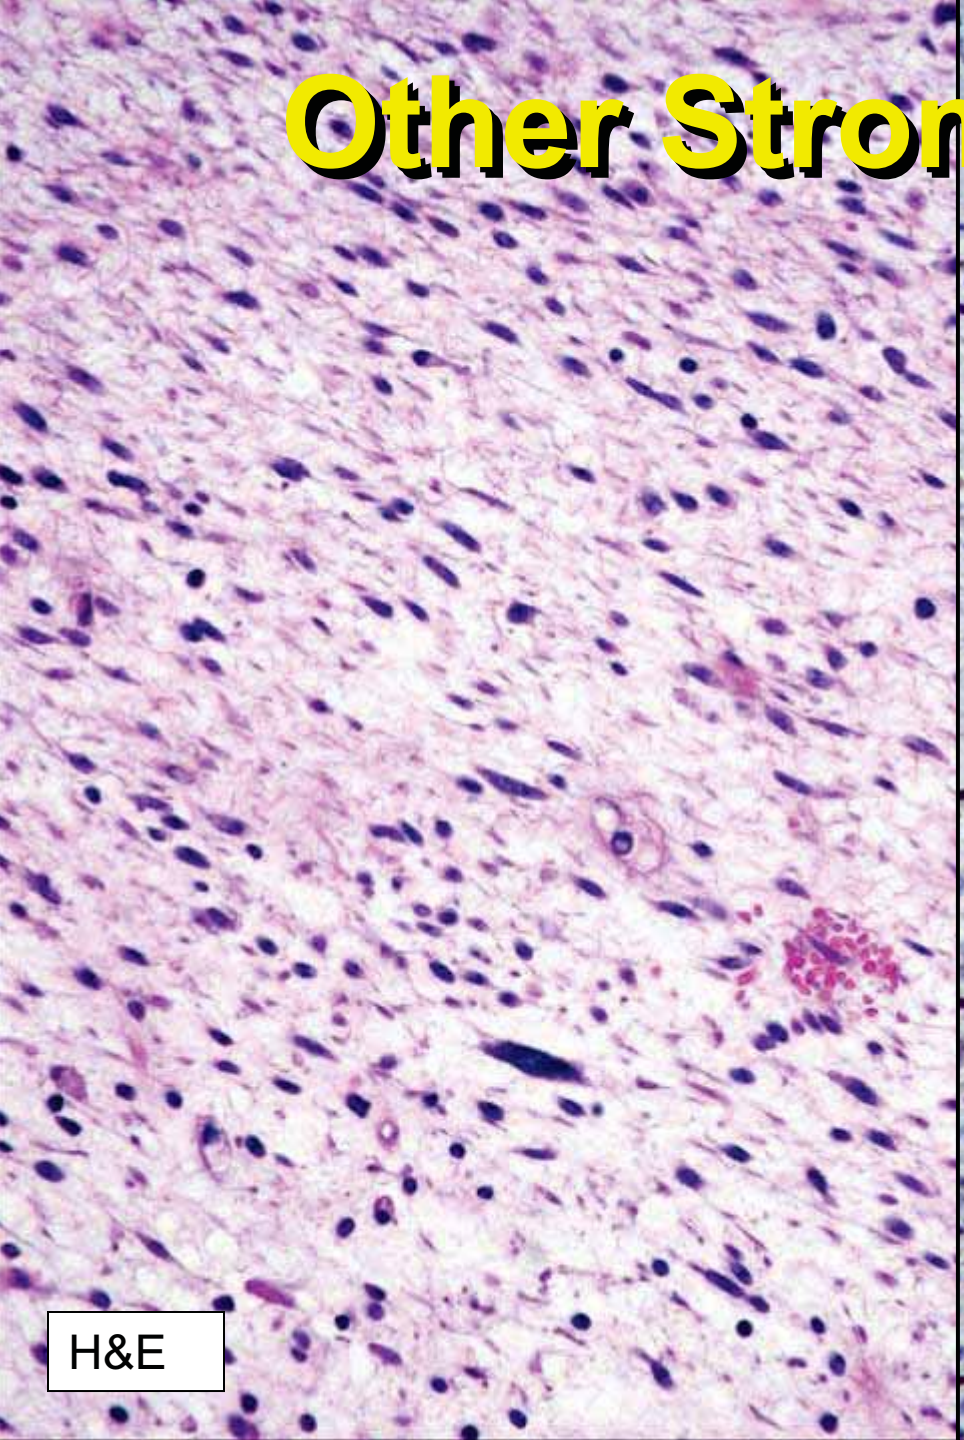
Results

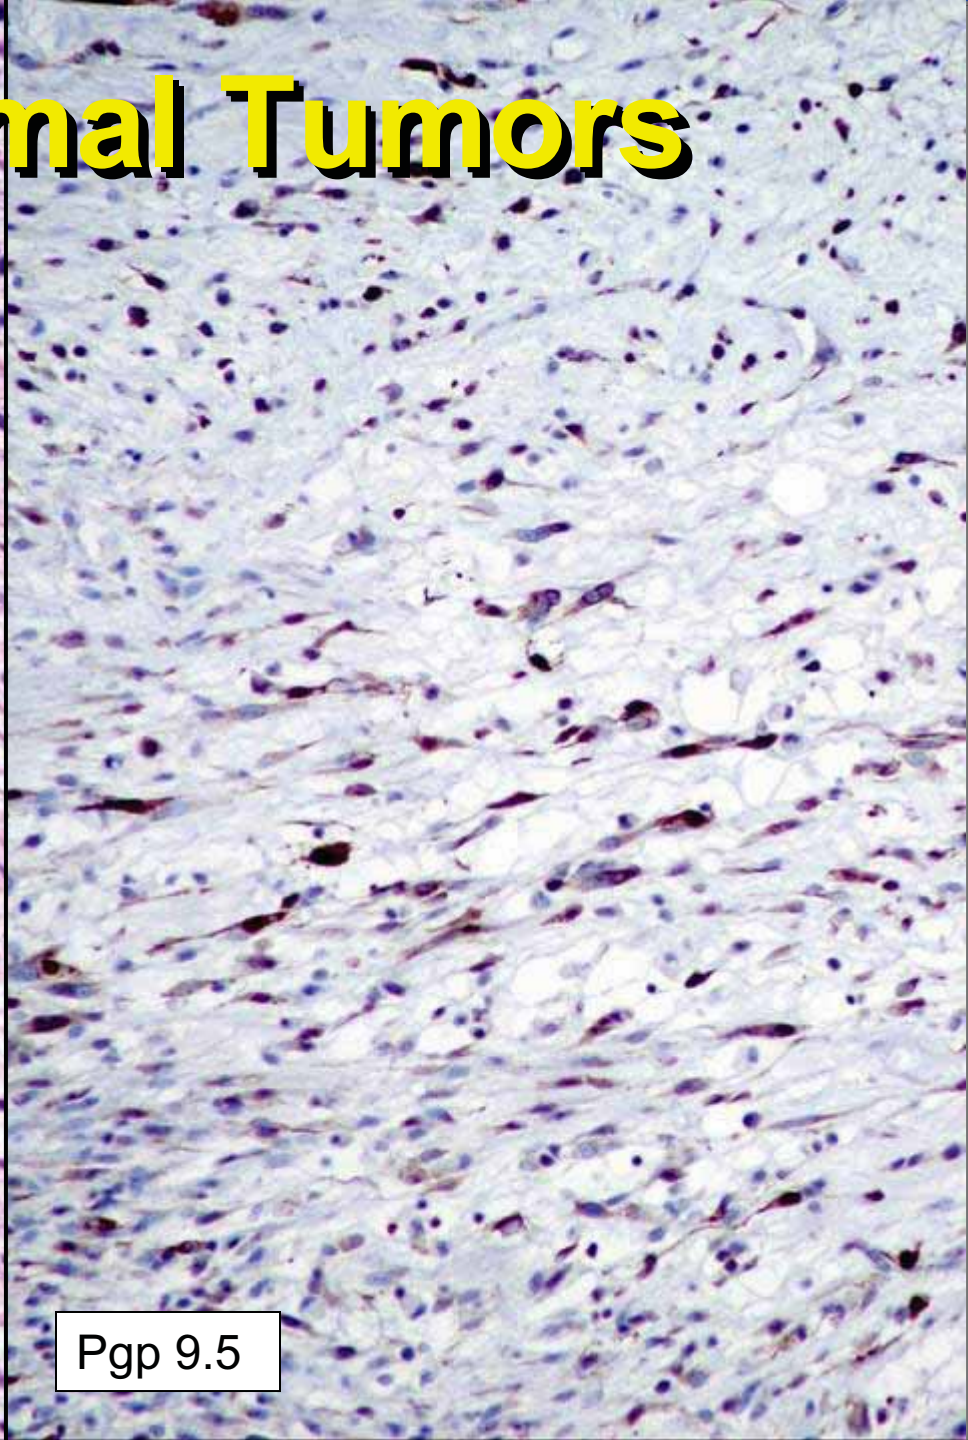
- 11 (24%) Non-GIST/non-smooth muscle origin
  - Vimentin: 100%
  - Desmin
  - S100
  - Pgp 9.5

Other Stromal Tumors



Other Stromal Tumors

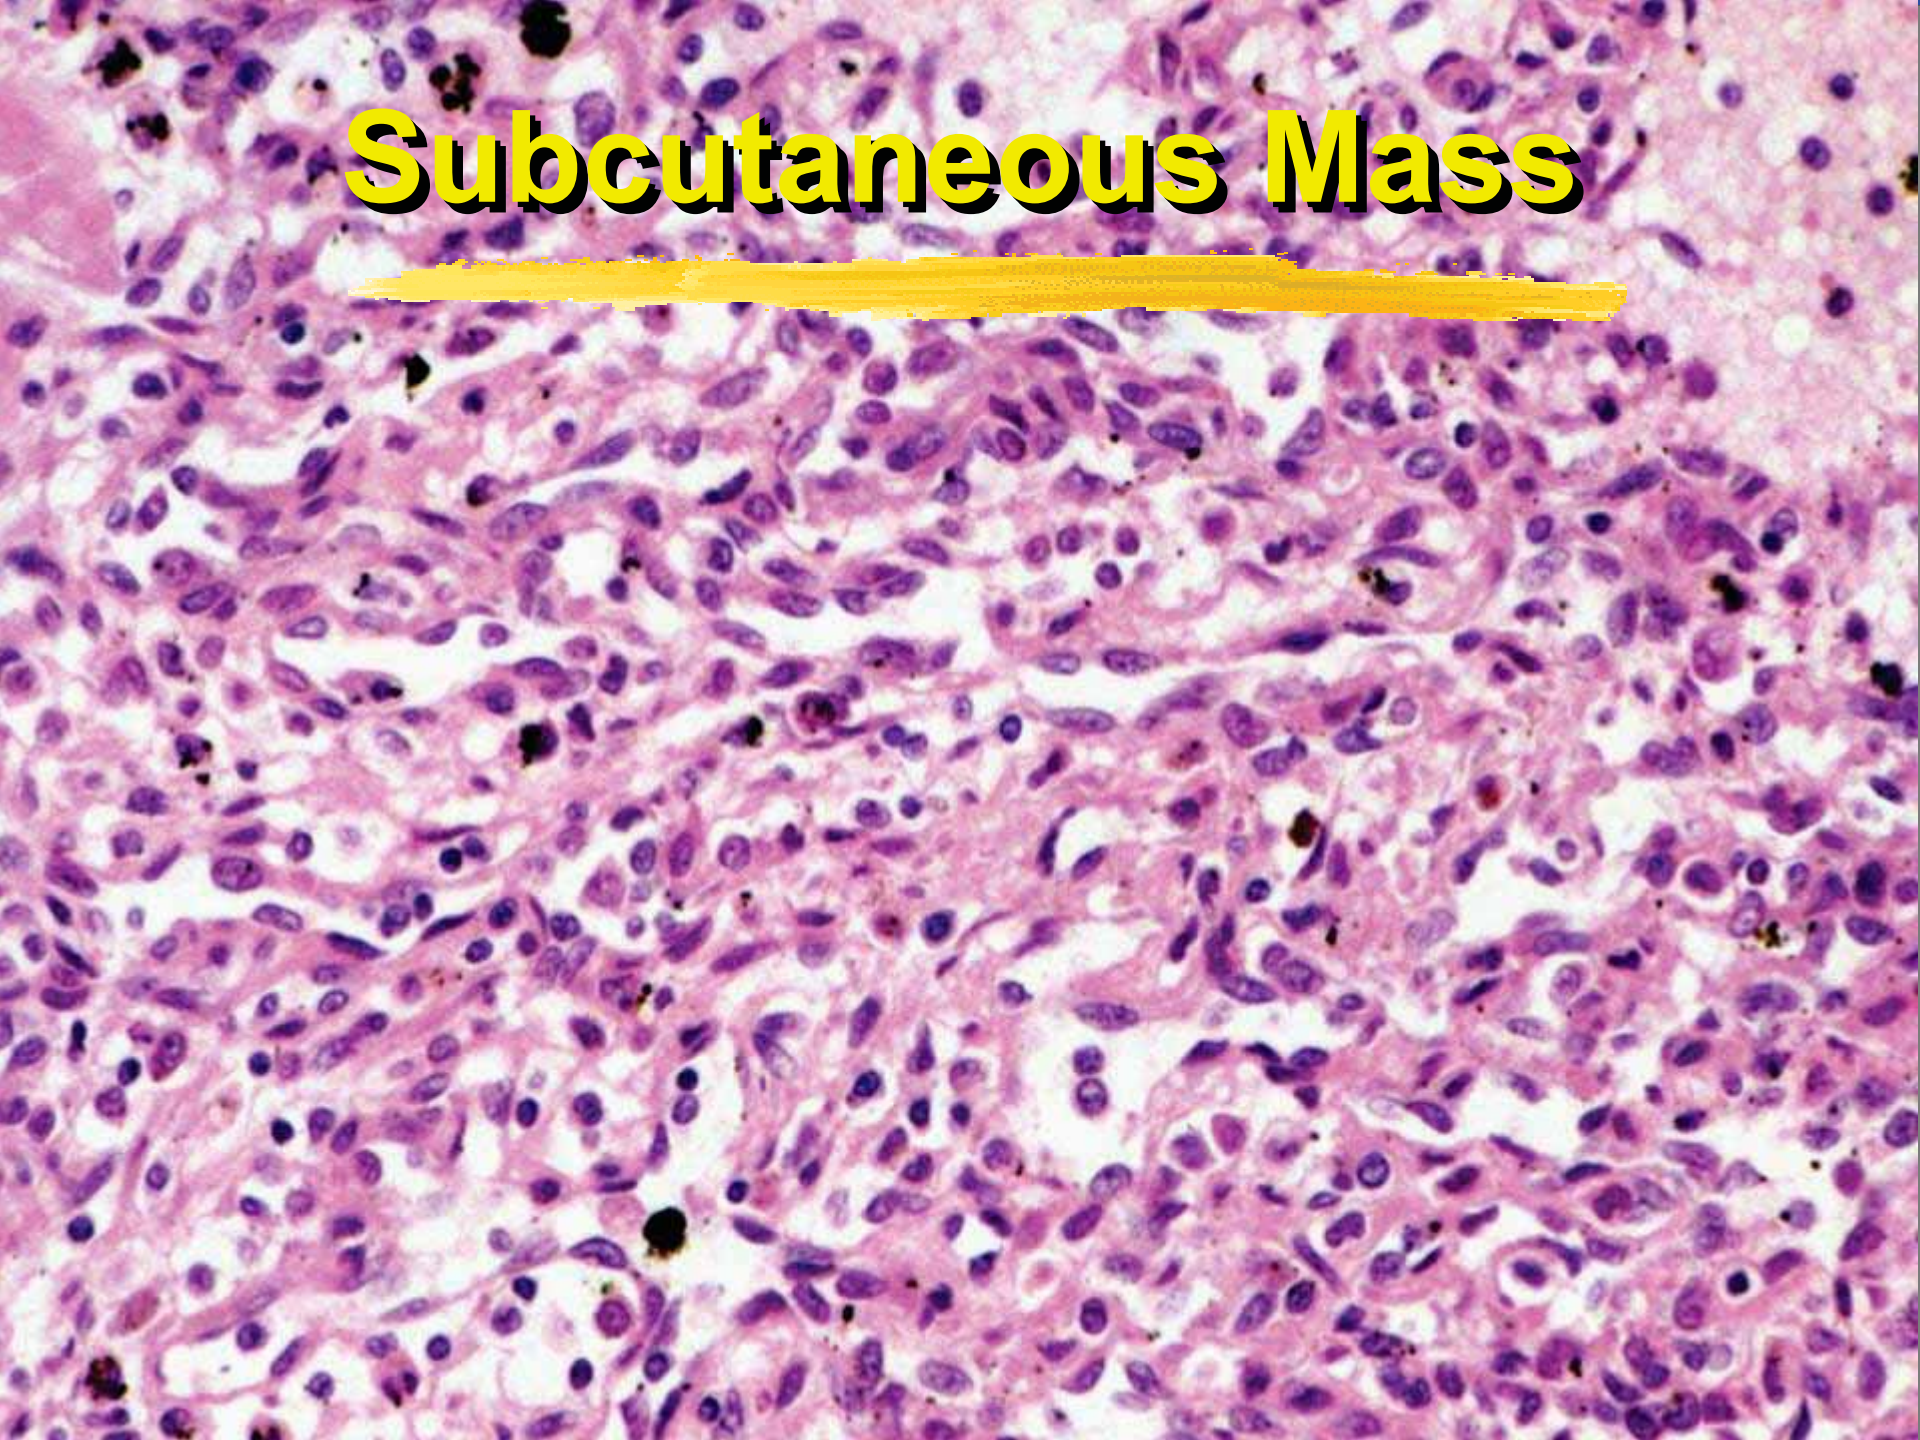


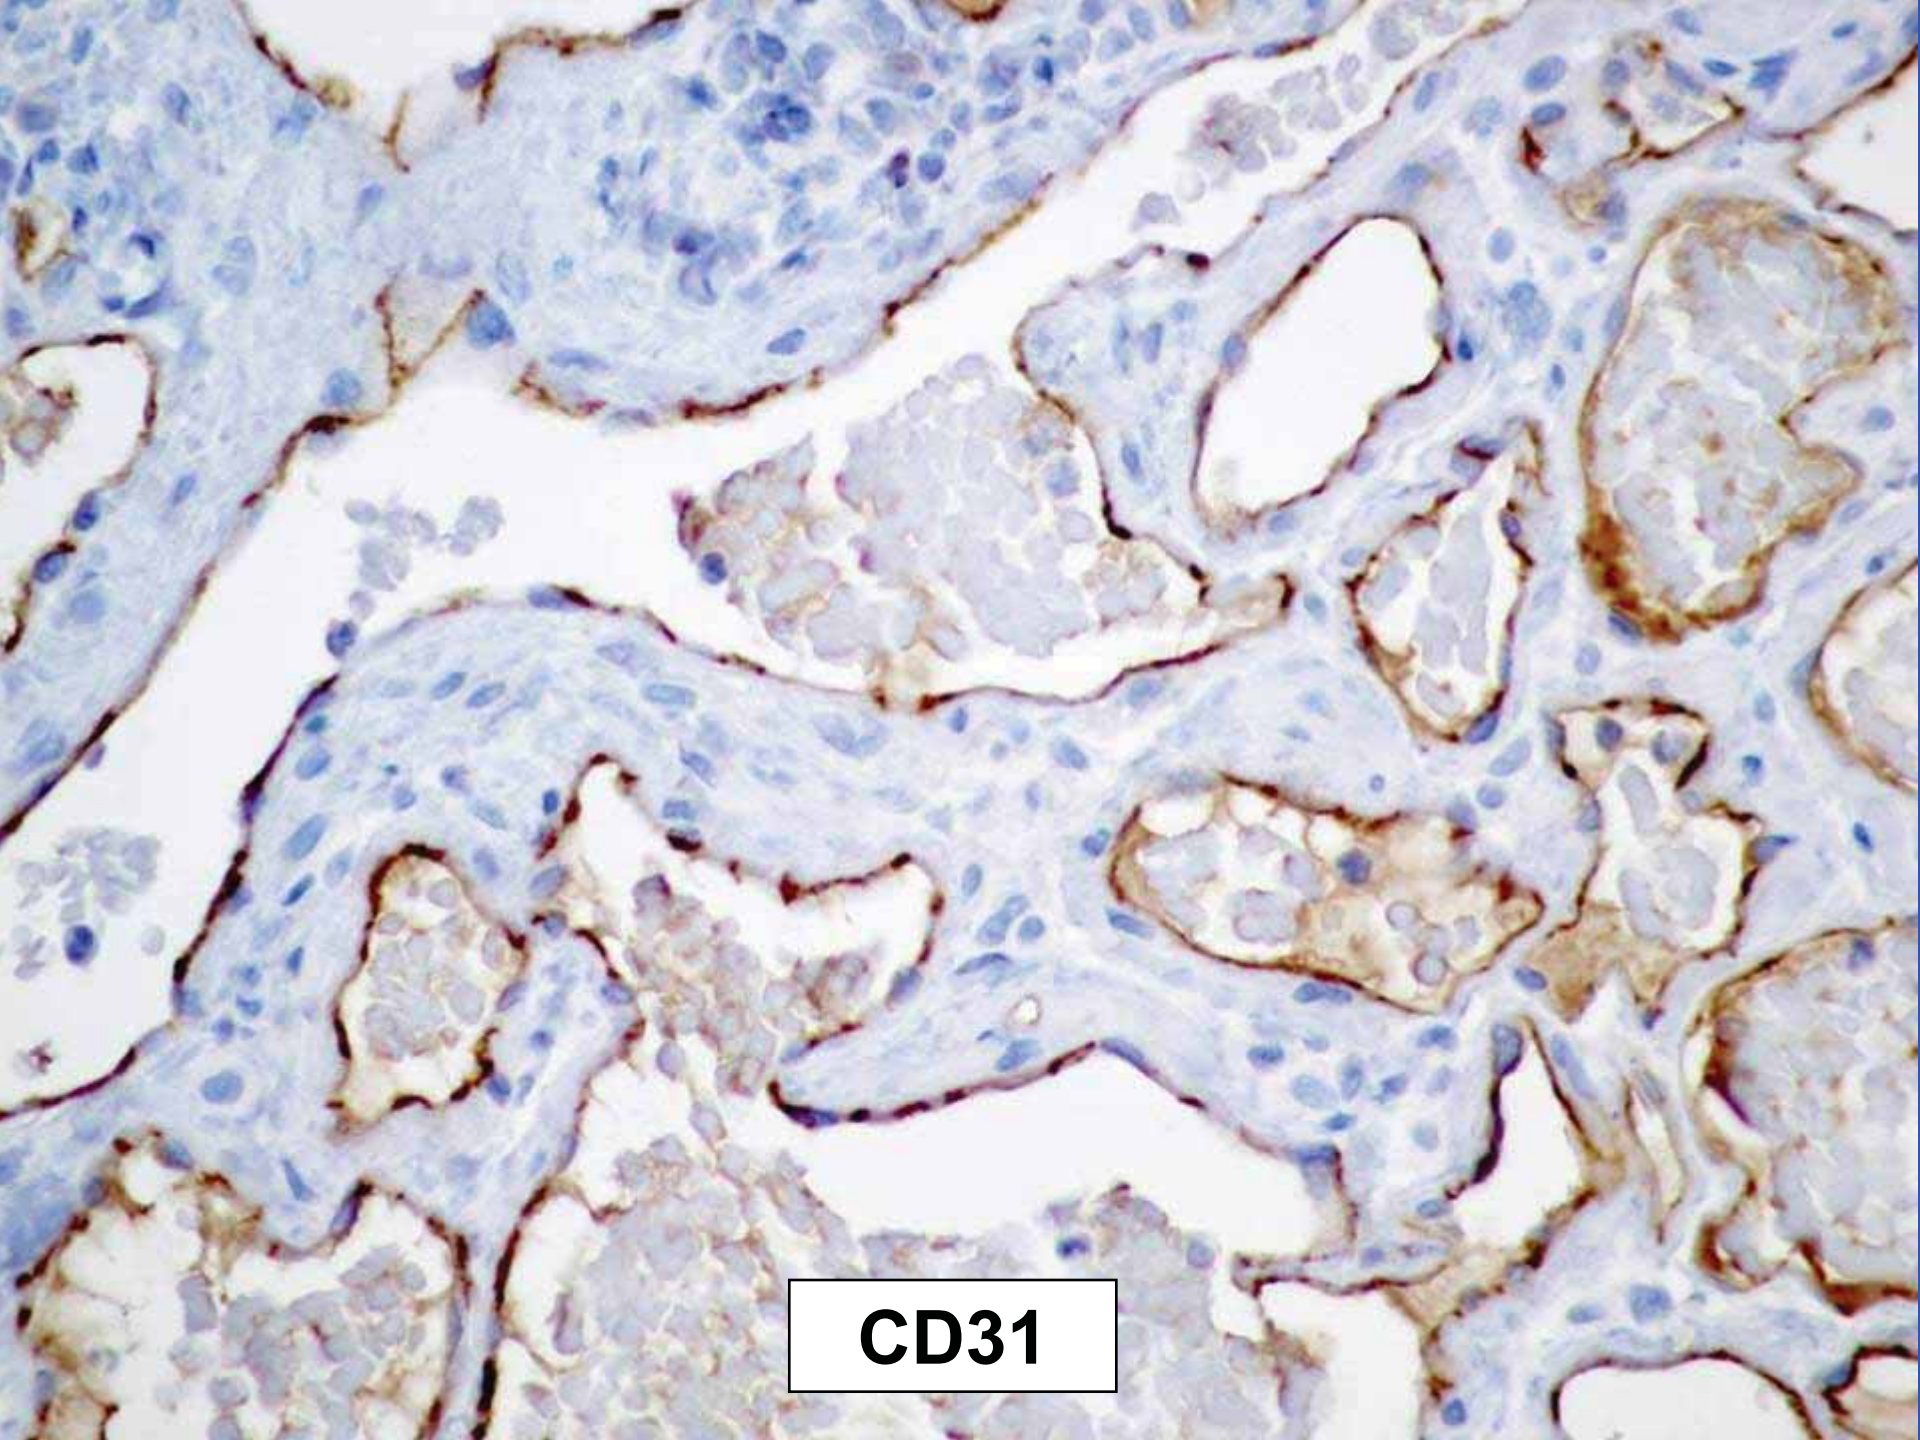


Non-angimatous, Non-lymphomatous Gastrointestinal Sarcomas

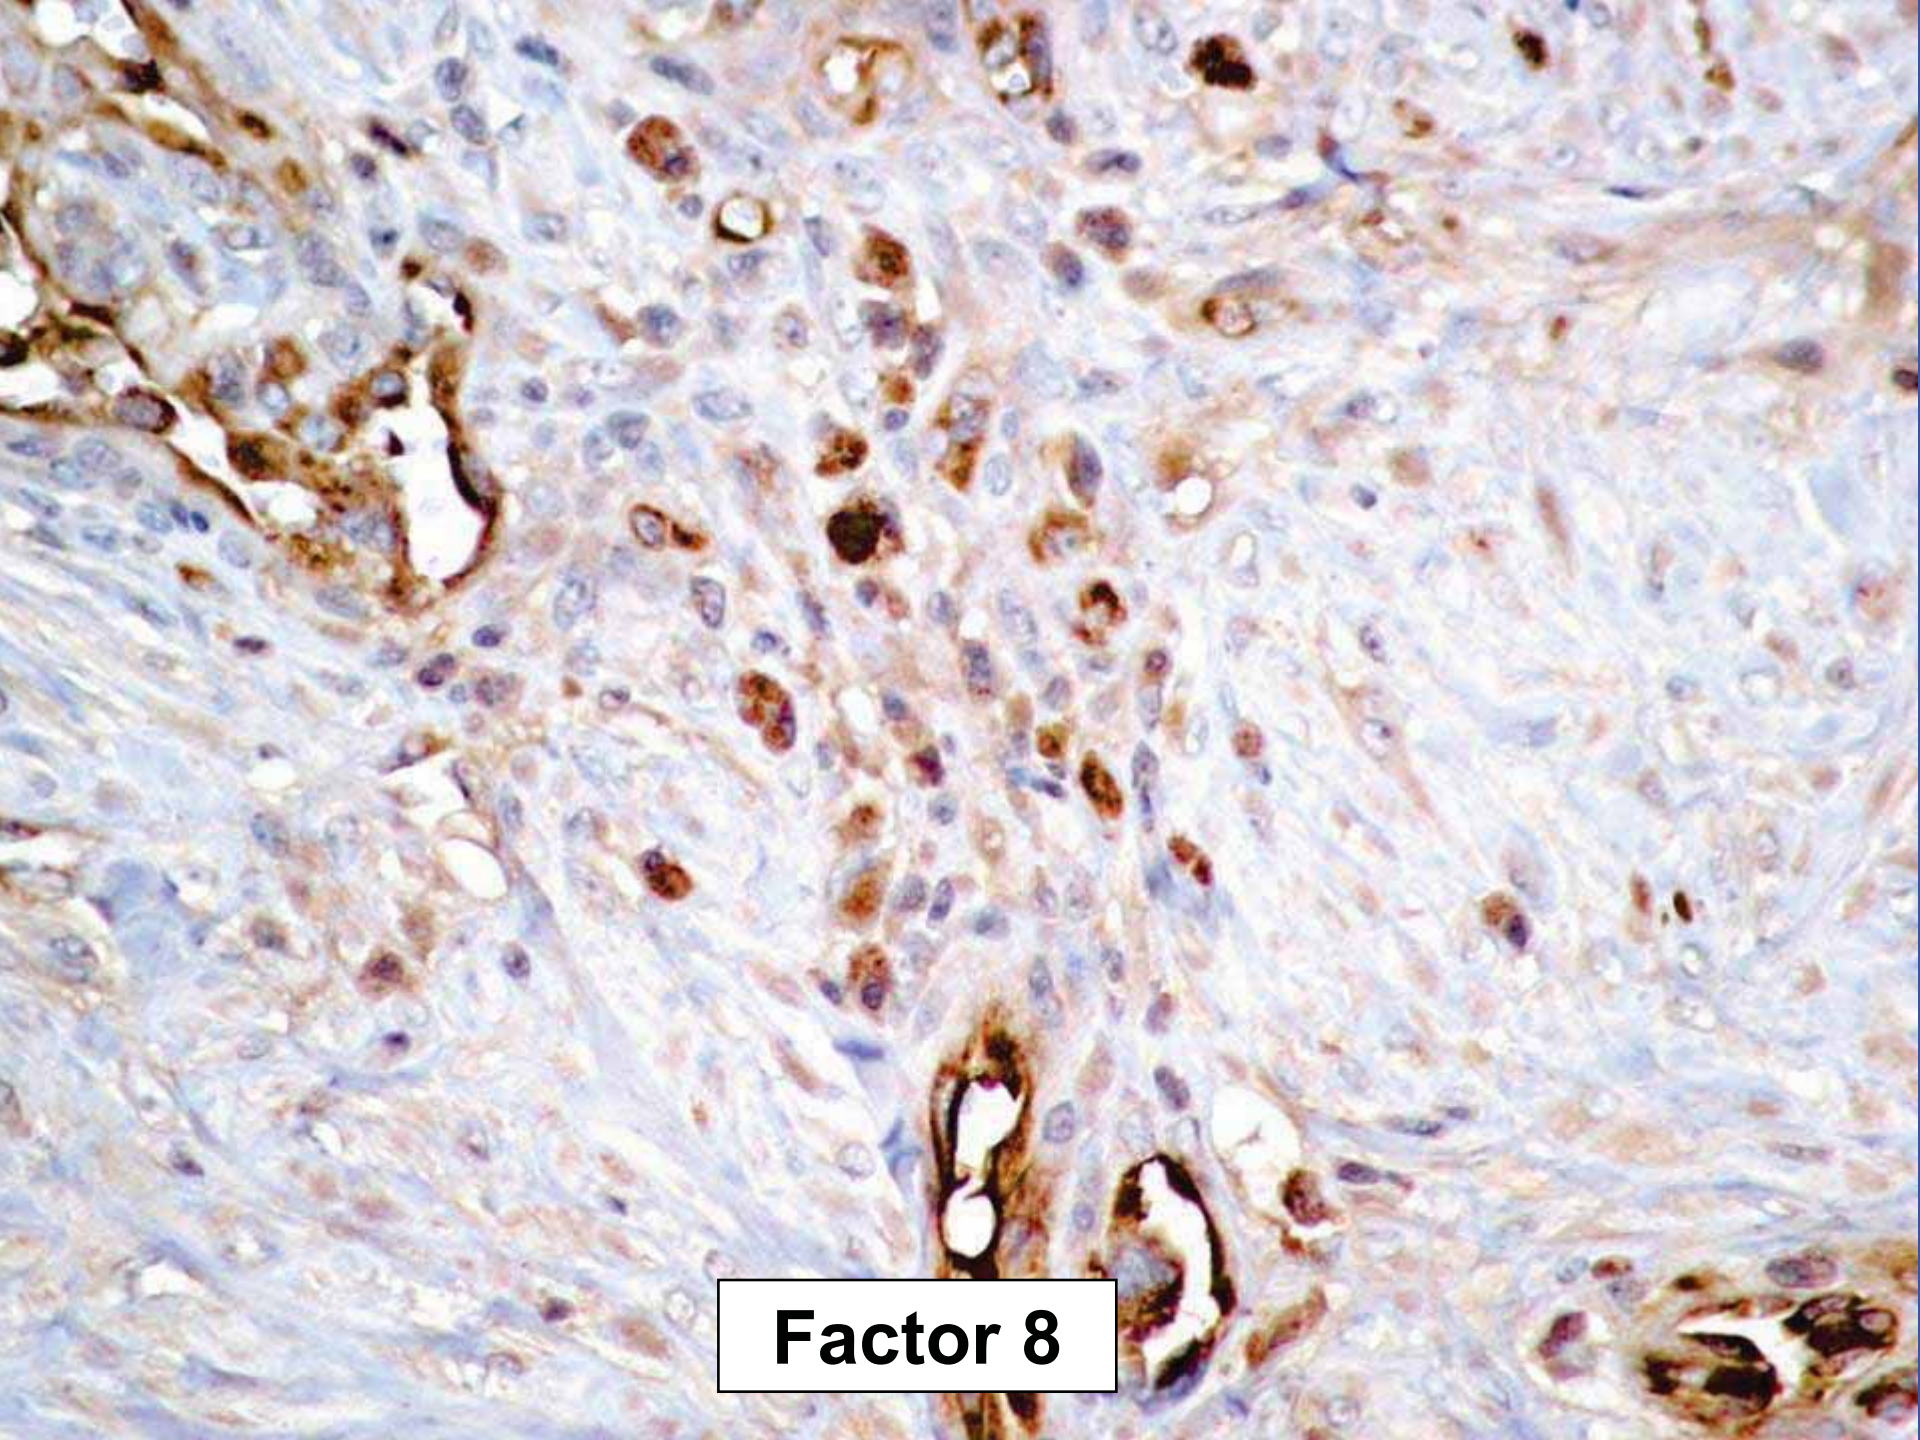
- Immunohistochemistry essential for diagnosis of non-lymphoid intestinal mesenchymal tumors
- Gastrointestinal stromal tumors and leiomyosarcomas have similar incidence
- Gastrointestinal stromal tumors tend to be more aggressive and have an increased potential for metastasis compared to leiomyosarcomas
- The expression of KIT and the presence of these mutations in *c-kit* implicate KIT in the pathogenesis of these tumors
- Indirect proportional staining for vimentin ans smooth muscle action reflects differention of leiomyosarcomas

Subcutaneous Mass

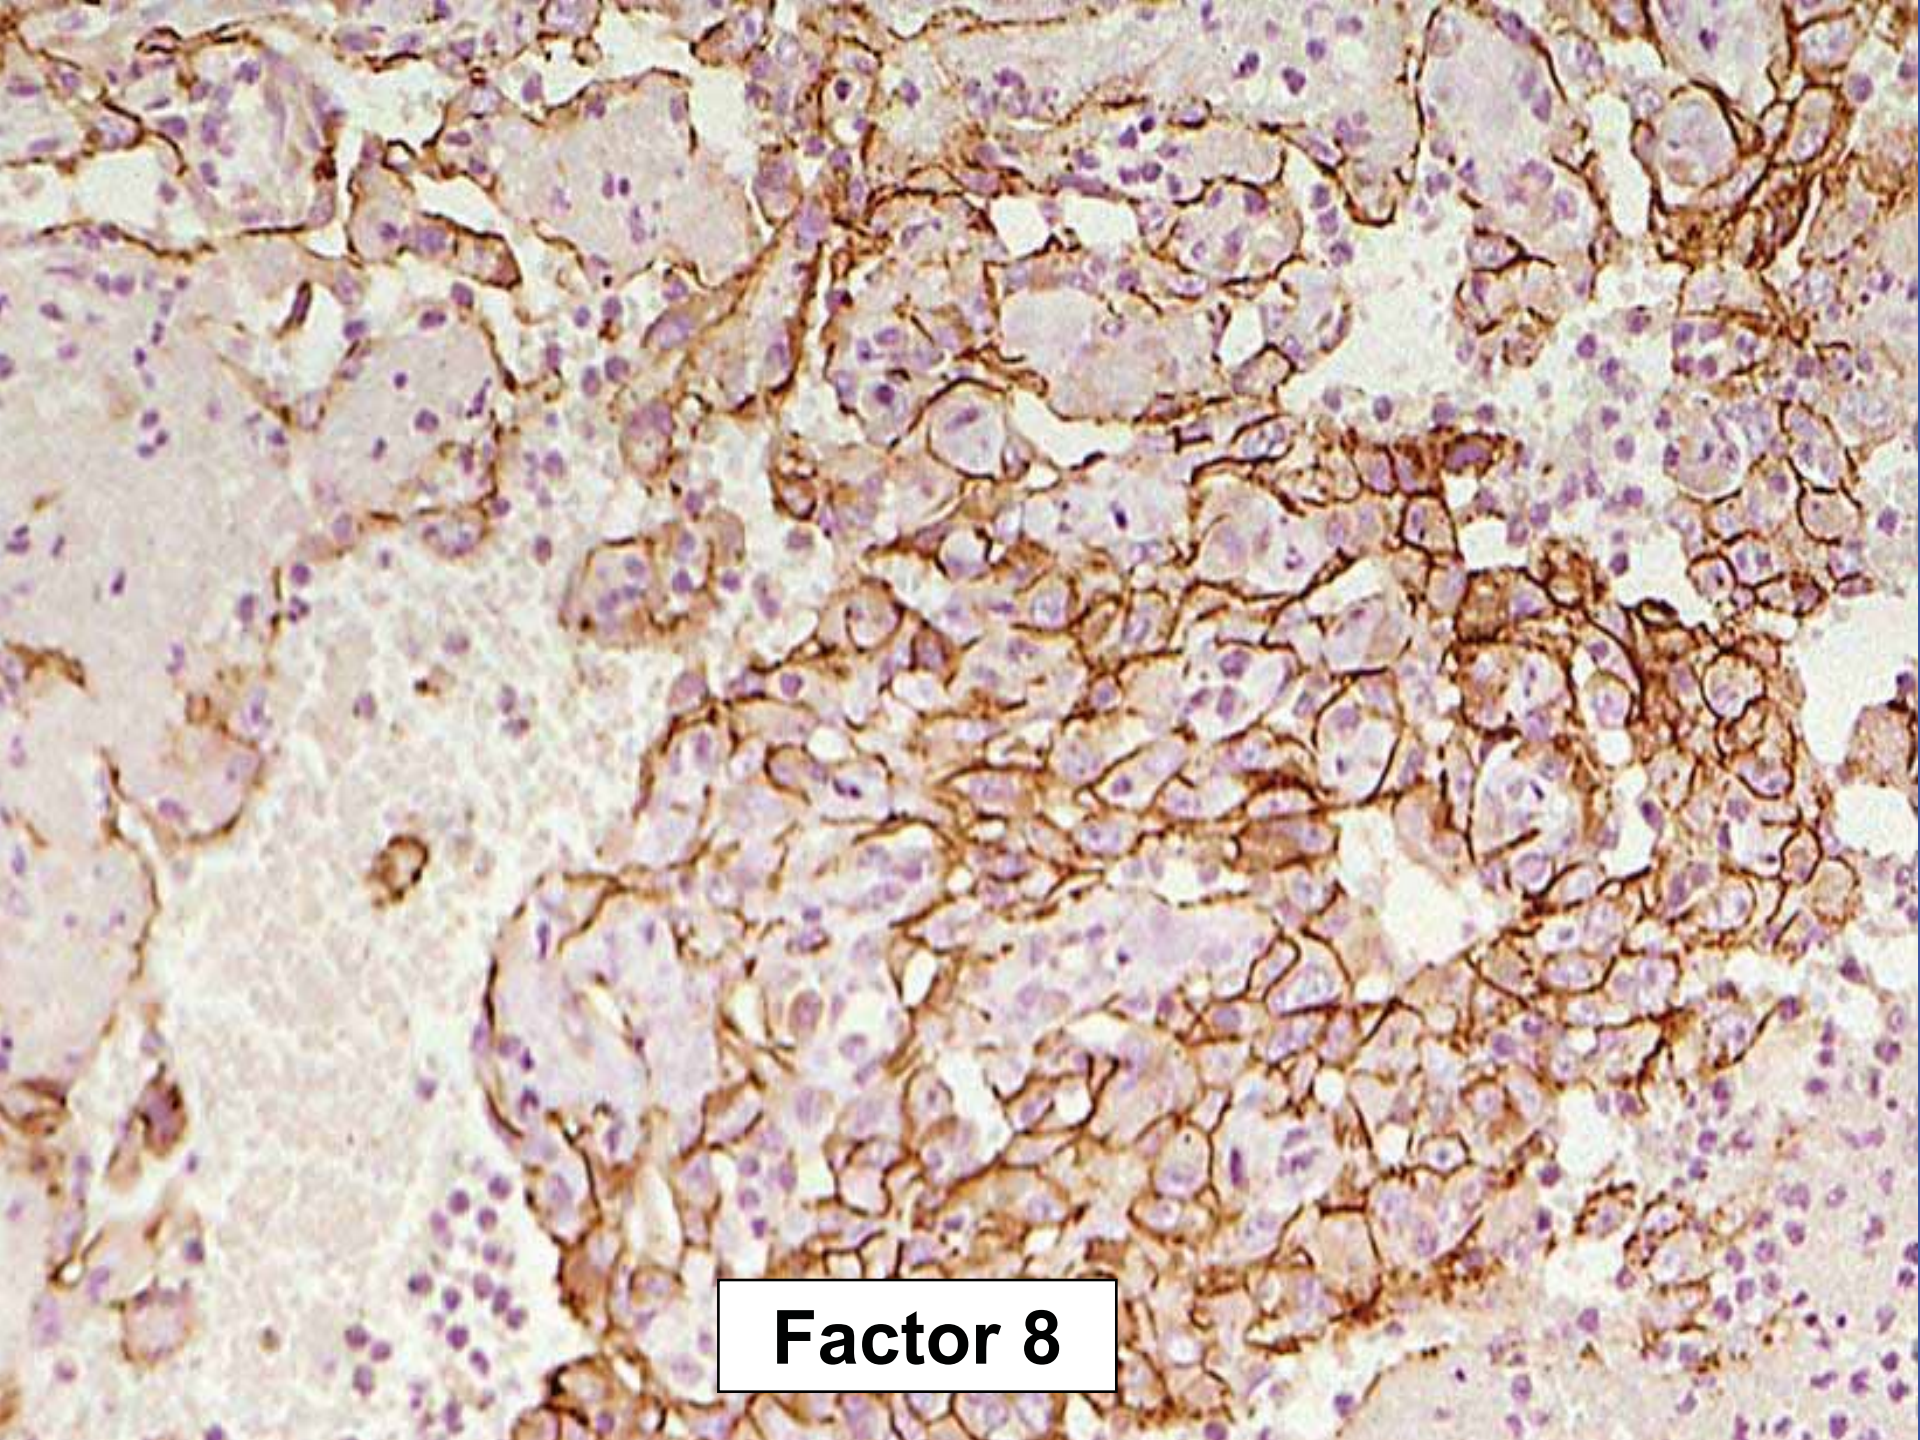




CD31



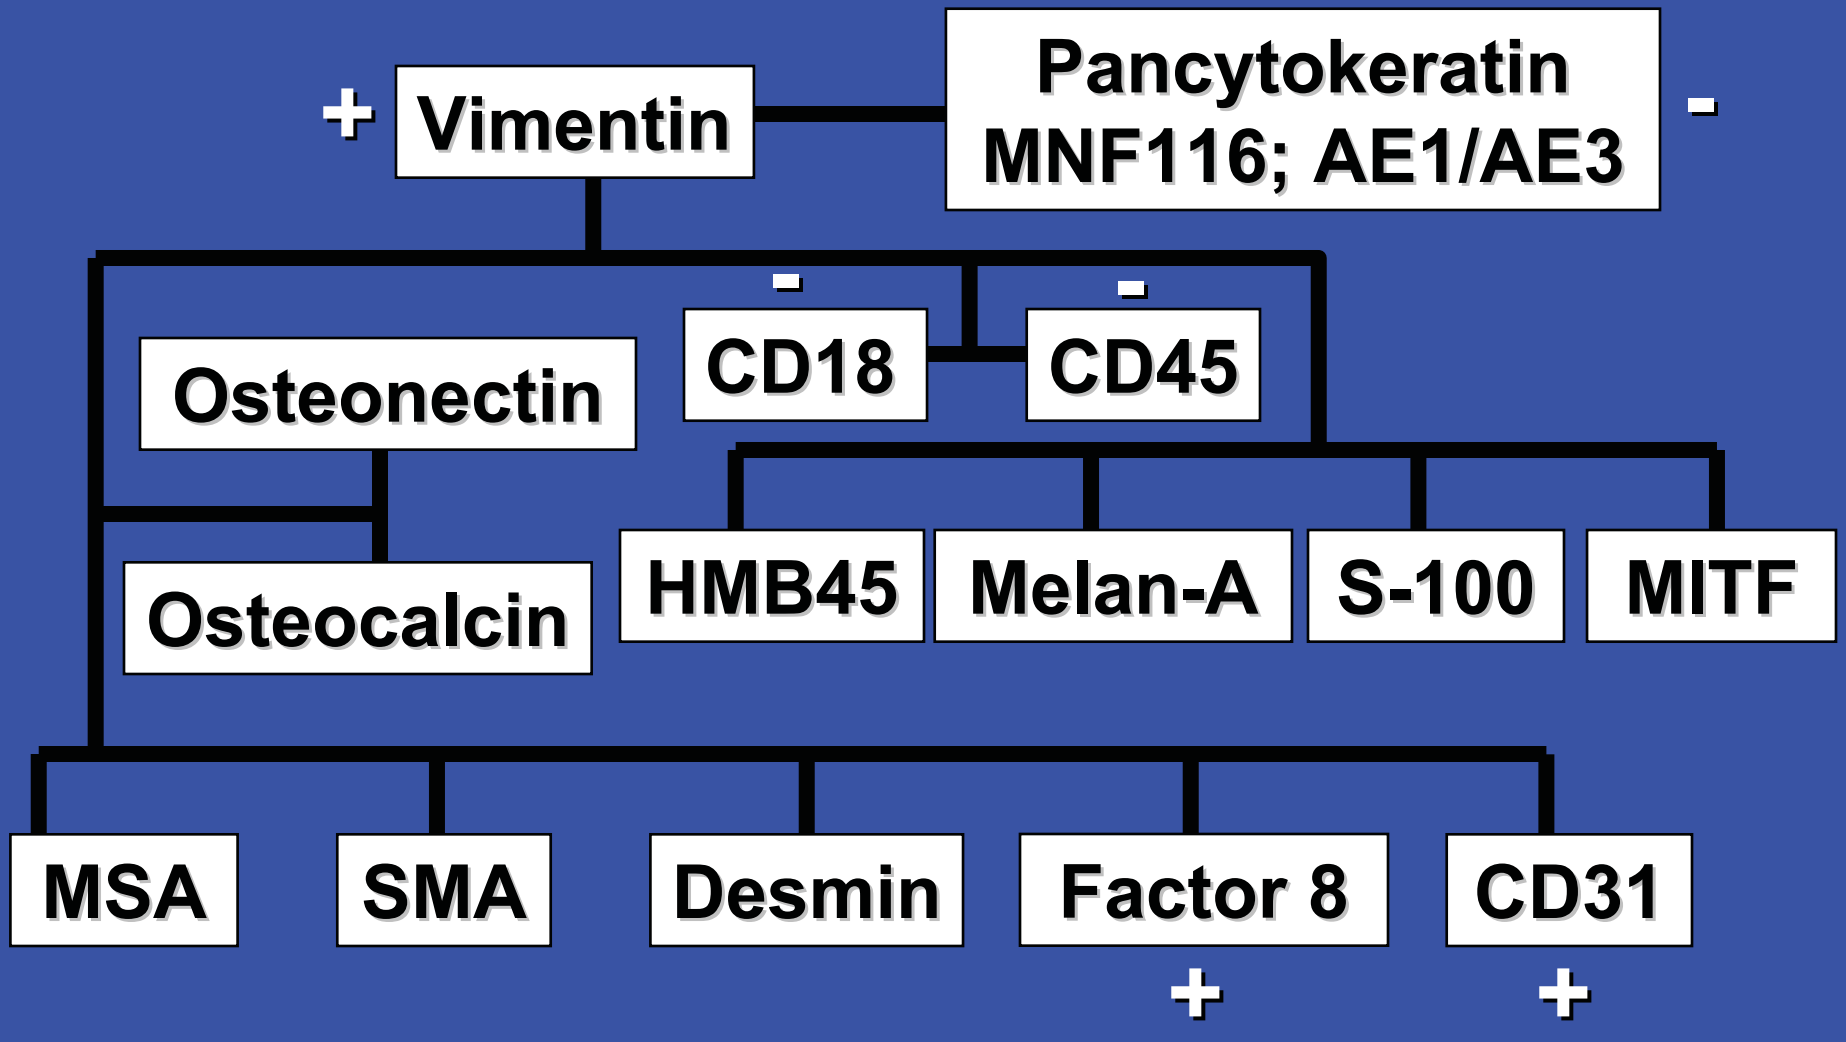
Factor 8



Factor 8

What's your Diagnosis

Hemangiosarcoma



Hemangiosarcoma

- Vimentin, CD31, factor 8
- Factor 8-related antigen and CD 31 (PECAM-1)
  - endothelial cells, megakaryocytes, platelets (CD31)
    - Factor 8: most vascular tumors
    - difficult to interpret with abundant blood
    - CD31: easier to interpret than Factor 8
    - more fixation sensitive

Other Vascular Markers

- LYVE-1
  - Receptor for extracellular matrix glycosaminoglycan hyaluronan (HA), homologue of CD44 in vessels
  - Specific for lymphatic endothelium (highly controversial: demonstrated in canine lymph nodes, but problems in inflammation and cancer)
- CD 34 (Hematopoietic progenitor cell antigen)
  - Stem cells of the hemopoietic system, endothelium
  - Not a diagnostic marker for vascular tumors
- Endoglin (CD105)
  - Receptor for TGF-β1 and TGF- β3
  - Almost no expression in normal blood vessels
  - High expression in proliferating vessels
- *Ulex Europaeus I* agglutinin (lectin), Thrombomodulin
  - Questionable use for vascular tumors
